CERTIFICATE OF MAILING UNDER 37 C.F.R. §1.8(a)

The undersigned hereby certifies that this document is being placed in the United States mail with first-class postage attached, addressed to Certificate of Correction Branch, Commissioner for Patents, P.O. Box 1450, Alexandria, VA 22313-1450, on the 26 day of July, 2006.

Mathieu J. Vargot

Certificate of Correction Branch

Commissioner For Patents

P.O. Box 1450

Alexandria, VA 22313-1450

Sir:

Transmitted herewith are the following documents:

- Second Supplemental Request for Certificate of Correction Under 37 C.F.R. §1.323
- Certificate of Correction
- Copy of Transmittal Letter to the United States Receiving Office
Dated June 12, 1998 (Attorney Docket No.: B1029.70001WO00)
- Document Comparing the Written Texts of U.S. Patent Application Serial No.: 08/873,952 as filed and International Application No.: PCT/US98/12295 as filed
- Return Receipt Postcard

If the enclosed papers are considered incomplete, the Mail Room and/or the Application Branch is respectfully requested to contact the undersigned at (617) 646-8000, Boston, Massachusetts.

Our check in the amount of \$100.00 covering the fee set forth in 37 CFR 1.20(a) is enclosed.

Certificate
JUL 28 2006
of Correction

**SECOND SUPPLEMENTAL REQUEST FOR CERTIFICATE OF CORRECTION
UNDER 37 C.F.R. §1.323**

Dear Sir:

Applicant submits herewith a Second Supplemental Request for Certificate of Correction under 37 C.F.R. §1.323 to correct an incorrect reference to a prior co-pending application in the priority claim language in column 1, lines 11-19 of the above-identified issued patent, which corrections do not constitute new matter or require re-examination. Applicant's Supplemental Request for Certificate of Correction under 37 C.F.R. §1.323 previously mailed by the Applicant on June 21, 2005 under 37 C.F.R. §1.8(a) to correct the same error was denied by the USPTO in a correspondence dated August 3, 2005. Applicant believes that this denial was in error and that the request should be granted for the reasons stated below. Applicant thanks Mr. Henry Randall of the Decisions & Certificates Branch for the courtesy of a telephone conversation with the undersigned who explained the chain of events leading to the present situation and who requested guidance as to how to further request that the desired correction be made. Mr. Randall suggested that the Applicant file a Second Supplemental Request for Certificate of Correction under 37 C.F.R. §1.323 explaining the events to date and why it is believed the decision to deny Applicant's previous request was in error.

Facts and Procedural Background

The present patent matured from an application (serial no. 09/445,733) which entered the National Phase in the United States under 35 U.S.C. §371 based on International Application Serial No. PCT/US98/12295. The International Application was filed claiming priority to United States Patent Application Serial No. 08/873,952 (now U.S. Patent No. 6,086,999). As shown on the attached copy of the Transmittal Letter to the United States Receiving Office dated June 12, 1998 filed at the time of filing the International Application, Applicant in Section II.D indicated that the International Application was identical to United States Patent Application Serial No. 08/873,952. As explained below, this was an inadvertent error made by Applicant's representative without any deceptive intent. In actuality, as clearly indicated by the record as evidenced by comparing the specification of the International Application as filed with the specification of United States Patent Application Serial No. 08/873,952 (see the attached document comparing the written texts of United States Patent Application Serial No. 08/873,952 as filed and International Application Serial No. PCT/US98/12295 as filed), substantial additional subject matter was added by International Application Serial No. PCT/US98/12295. It is believed that this inadvertent mistake by Applicant's representative at the time of filing International Application Serial No. PCT/US98/12295 led to the incorrect characterization of International Application Serial No. PCT/US98/12295 as a continuation of United States Patent Application Serial No. 08/873,952 in the PALM database of the USPTO. In fact, the proper relationship between the above two applications is that International Application Serial No. PCT/US98/12295 is a continuation-in-part of United States Patent Application Serial No. 08/873,952. In order to comply with the requirements of 35 U.S.C. §120 and 37 C.F.R. §1.78(a)(2)(i), Applicant wishes to correct the presently recited familial relationship between International Application Serial No. PCT/US98/12295 and United States Patent Application Serial No. 08/873,952 as indicated in the appended Certificate of Correction.

Applicant initially submitted a Request for Certificate of Correction under 37 C.F.R. §1.323 on September 15, 2004 for the above-identified issued patent requesting that in Column 1, Line 14, the text be corrected to read "is a continuation-in-part of" instead of "claims priority to" as printed. On May 24, 2005, the Patent Office issued a Certificate of Correction; however, the correction substituted "is a continuation of" for "claims priority to" instead of substituting "is a continuation-

in-part of” for “claims priority to” as Applicant requested. The image file wrapper available on public PAIR indicates that on November 21, 2004, Supervisory Patent Examiner Michael P. Colaianni indicated that Applicant’s request should be denied because the PALM database indicated that International Application Serial No. PCT/US98/12295 was a continuation of United States Patent Application Serial No. 08/873,952 and not a CIP. As noted above and as indicated by a review of the record [specifically by comparing the text of the applications as filed], this designation is incorrect and was due to an inadvertent error of Applicant’s representative.

Applicant believes that the initial submission in support of the issued Request for Certificate of Correction under 37 C.F.R. §1.323 may have inadvertently created confusion as to whether the above-identified issued patent is properly a continuation of or a continuation-in-part of U.S. Patent Application Serial No. 08/873,952 (now U.S. Patent No. 6,086,999). Specifically, it is noted that on the copy provided of the Transmittal Letter submitted to the United States Receiving Office with International Application No. PCT/US98/12295 upon filing of the International Application, which is also included as part of the present submission, in item II.D, the box indicating that the International Application “is identical to” U.S. Patent Application Serial No. 08/873,952 was checked. This was an inadvertent error made in good faith without deceptive intent. Instead, the box adjacent to item II.E should have been checked, indicating that the International Application “contains additional subject matter not found in [U.S. Patent Application Serial No. 08/873,952].” It is readily apparent upon reviewing the text of U.S. Patent Application Serial No. 08/873,952 as filed and International Application No. PCT/US98/12295 as filed that the specifications are not identical and that additional text was included in International Application No. PCT/US98/12295. Accordingly, it is believed that it is clear from the Patent Office Record that the proper relationship of International Application No. PCT/US98/12295 to U.S. Patent Application Serial No. 08/873,952 is as a continuation-in-part.

On June 21, 2005, Applicant mailed under 37 C.F.R. §1.8(a) a Supplemental Request for Certificate of Correction under 37 C.F.R. §1.323 requesting that the language of the priority claim be corrected to recite the proper relationship of CIP. A letter addressed to Applicant’s representative dated August 3, 2005 in the image file wrapper indicates that Applicant’s Supplemental request was denied. Applicant notes that the delay in making this Second

Supplemental Request is owing to the fact that Applicant's representative has no record of ever having received the above letter denying Applicant's Supplemental Request. The basis of the denial given in the letter is that because the language of the priority claim is in accord with the record of the USPTO and because the error was, therefore, no fault of the USPTO, it has no authority to issue a Certificate of Correction under the provision of 37 C.F.R. §1.322. It is respectfully believed that the basis for this denial is incorrect. Applicant notes that the previous request was made not made pursuant to the provisions of 37 C.F.R. §1.322 but rather pursuant to the provisions of 37 C.F.R. §1.323, which permit correction of applicant errors that are no fault of the USPTO. It is just such an error – an inadvertent mistake by Applicant in failing to properly note the relationship between applications in a priority claim – that Applicant now wishes to correct. This mistake is clearly correctable via Certificate of Correction under 37 C.F.R. §1.323 as indicated in MPEP §1481.03. As shown below, all of the requirements set forth in MPEP §1481.03 for correcting an incorrect reference to a to a prior copending application pursuant to 37 C.F.R. §1.78(a)(2) are satisfied in the present case.

In support of the present Second Supplemental Request for Certificate of Correction , as indicated below, Applicant includes as part of the present submission a document comparing the written texts of U.S. Patent Application Serial No. 08/873,952 as filed and International Application No. PCT/US98/12295 as filed illustrating changes and showing that the proper relationship between these applications is that International Application No. PCT/US98/12295 is a CIP of U.S. Patent Application Serial No. 08/873,952 and not a continuation.

Summarizing the basis and support for the present Second Supplemental Request for Certificate of Correction under 37 C.F.R. §1.323, Applicant inadvertently did not properly indicate the relationship between International Application No. PCT/US98/12295, of which the instant patent was granted on a national stage filing thereof, and U.S. Patent Application Serial No. 08/873,952 (now U.S. Patent No. 6,086,999) to which the International Application claimed the benefit of priority. The priority claim should have recited that International Application No. PCT/US98/12295 is a continuation-in-part of U.S. Patent Application Serial No. 08/873,952, now U.S. Patent No. 6,086,999. The attached certificate of correction effects this correction. The mistake was made in good faith.

Applicants note that the instant application was granted on an application filed prior to November 29, 2000, and that, therefore, the version of 37 C.F.R. §1.78 in effect as of November 29, 2000 applies. Applicants further note that all of the requirements set forth in the version of 37 C.F.R. §1.78(a)(1) in effect as of November 29, 2000 have been met in the application that matured into the instant patent to be corrected. In addition, it is clear from the record of the patent and patent application (e.g. via a comparison of the written texts of the applications as filed) that the indicated priority is appropriate, even though the priority data indicated in the PALM database erroneously lists the relationship as “continuation” owing to Applicant’s inadvertent mistake, as noted above. As evidence, Applicant includes herewith a copy of:

- (1) copies of the Transmittal Letter (mistakenly indicating that International Application No. PCT/US98/12295 “is identical to” U.S. Patent Application Serial No. 08/873,952 instead of indicating that the International Application “contains additional subject matter not found in [U.S. Patent Application Serial No. 08/873,952]” –see discussion above) and PCT Request form submitted to the United States Receiving Office with International Application No. PCT/US98/12295 upon filing, which clearly indicates that the International Application designated the United States of America (page 2 of Request) and claimed priority to U.S. Patent Application Serial No. 08/873,952 (page 3 of Request);
- (2) a copy of the Notice of Status of Requirements Under 35 U.S.C. 371 form mailed by the U.S. Patent and Trademark Office upon receipt of the International Application indicating the International Application Number and acknowledging Applicant’s priority date claimed (i.e. the 12 June 1997 filing date of U.S. Patent Application Serial No. 08/873,952); and
- (3) a document comparing the written texts of U.S. Patent Application Serial No. 08/873,952 as filed and International Application No. PCT/US98/12295 as filed and showing changes with text added in the International Application indicated in double underline and deletions of text present in U.S. Patent Application Serial No. 08/873,952 in strike-through.

~~METHOD FOR PRODUCING A GRADED INDEX~~¹³
~~PLASTIC OPTICAL MATERIAL~~¹⁴

GOVERNMENT FUNDING

The invention described herein was made in whole or in
part with government support under a contract issued by the Defense Advanced
Research Projects Agency (DARPA) in response to DARPA solicitation #BAA96-29 and
under contract number DAA20L-94-C-3425 with the Defense¹⁵ Advanced Research

Projects Agency (ARPA¹⁶ DARPA¹⁷). The United States Government may have certain rights in the invention.

BACKGROUND OF THE INVENTION

Optical resin materials which are characterized by a distributed refractive index have ~~demonstrated usefulness~~¹⁸ proved useful¹⁹ in the construction of optical conductors such as, optical fibers, optical waveguides, and²⁰ optical integrated circuits as well as²¹, and²² the corresponding preforms of²³ from which²⁴ these optical²⁵ conductors are fabricated²⁶. In general, plastic or polymeric²⁷ optical fibers (POF) are considered an attractive alternative to copper cable and glass optical fibers. Typically, the plastic optical fiber (or thin, flexible optical²⁸ rod) has a an elongated²⁹ core within which the majority of the³¹ light travels in a generally axial direction³² and a sheathing layer which coaxially³³ surrounds the core³⁴ and³⁵ confines the

~~light to the core and possesses~~³⁶ due to its having³⁷ an index of refraction less than that of the core.

The refractive index distribution of plastic optical fibers can be classified as either a gradient (or graded)³⁹ index or step index. However, graded⁴¹ gradient⁴² index plastic optical fibers (GI POF) are preferred over step index fibers for many⁴³ data communication applications. That is, the due to their superior bandwidth capacity⁴⁴. The index of refraction⁴⁵ in a graded⁴⁷ gradient⁴⁸ index plastic optical fiber has a distribution that continuously changes within the core of the⁴⁹ fiber, generally decreases⁵⁰ decreasing⁵¹ radially from a maximum value at⁵² the core center outward⁵³ central axis outwardly⁵⁴ until it matches⁵⁵ approaches the lower index of refraction of⁵⁶ the sheathing index⁵⁷ at or near⁵⁸ the core-sheathing interface. Therefore, Due to this continuously varying refractive index within the core, the optical fiber acts like a lens tending to refocus light rays, reducing their propagation in non-axial directions, so that⁶⁰ light rays entering the core at a small angle, with respect to the axis, follow undulating paths, ~~which is not the case for~~⁶¹ with relatively small deviations from the axial direction when compared to light propagation in⁶² a step index type fiber. The In addition,⁶³ the speed of the light rays along the⁶⁵ following⁶⁶ undulating paths increases⁶⁷ is higher⁶⁸ in the regions of lower refractive index so that the total⁶⁹ travel time along these⁷⁰ for light rays following undulating⁷¹ paths is nearly equal to that along the⁷² those following a⁷³ straight axial path. This results in, for example, a fiber with a⁷⁴ wider bandwidth of transmission with minimal modal dispersion and a more rapid information flow than that obtained with step index plastic optical fibers.

In general, typical⁷⁵ methods of fabricating graded⁷⁶ gradient⁷⁷ index plastic optical materials ~~comprise~~⁷⁸ fibers involve⁷⁹ preparation of a polymeric sheathing and a polymeric core disposed within the sheathing⁸⁰ in a coaxial configuration⁸¹. The refractive index of the core and sheathing are different ~~in that~~⁸² and, for most optical conducting applications,⁸³ the refractive index of the core is greater than that of the sheathing. Frequently, the core is made of

⁸⁴ the same polymer as that which comprises the sheathing but, in addition, further⁸⁵ includes a non-polymeric substance (commonly referred to as a dopant) which causes⁸⁶ increases⁸⁷ the refractive index of the core ~~to be~~⁸⁸ so that it is⁸⁹ greater than that of the sheathing. (⁹⁰ See for example, U.S. Patent No. 5,541,247 to Koike.)⁹¹

However, currently available methods of fabrication have significant shortcomings. For example, the type and ~~35~~⁹² amount of dopant⁹³ substances which can be incorporated into the

~~3~~⁹⁴ core and still provide a graded⁹⁵ gradient⁹⁶ index plastic optical material⁹⁷ article⁹⁸ which maintains both sufficient optical⁹⁹ transparency and an acceptable difference in the refractive index between the sheathing and the core, are limited. Therefore, a need exists for methods and materials useful for fabricating graded¹⁰⁰ improved gradient¹⁰¹ index plastic optical materials¹⁰² articles¹⁰³.

SUMMARY OF THE INVENTION

The ¹⁰⁴ One aspect of the¹⁰⁵ present invention is based upon the discovery that, ~~surprisingly,~~¹⁰⁶ a graded¹⁰⁷ gradient¹⁰⁸ index plastic optical material¹⁰⁹ article¹¹⁰ having excellent optical characteristics can be achieved¹¹¹ produced¹¹² using a method of manufacturing, which¹¹³ fabrication that¹¹⁴ incorporates a low refractive index dopant (i.e., ¹¹⁵ having a refractive index¹¹⁶ lower than that of¹¹⁷ the polymer of¹¹⁸ comprising¹¹⁹ the sheathing but without the¹²⁰ dopant¹²¹) in the sheathing of the material¹²² article.

The present invention ~~thus~~¹²³ in another aspect¹²⁴ relates to a graded¹²⁵ gradient¹²⁶ index plastic optical material¹²⁷ article¹²⁸, and methods of processing the material¹²⁹ article¹³⁰. The method¹³¹ methods¹³² of the invention provides¹³³ provide¹³⁴ for the use of a significantly broader selection of dopant and polymeric¹³⁵ materials which consequently provides a graded¹³⁶ can be used to produce a functional gradient¹³⁷ index plastic optical fiber¹³⁸ article¹³⁹ with excellent optical characteristics. For example, the method¹⁴⁰ methods¹⁴¹ of the invention allows¹⁴² allow for¹⁴³ control of the graded¹⁴⁴ gradient¹⁴⁵ refractive index of the material and thereby produces a graded¹⁴⁶ for a wider range of differences in refractive indices between the core and sheathing for a given concentration of core dopant thereby producing a gradient¹⁴⁷ index plastic optical material¹⁴⁸ article¹⁴⁹ with a low loss due to light attenuation¹⁵⁰ and broad transmission bandwidth, having a high level of transparency, a substantial absence of bubbles and good environmental stability, for example, enhanced thermal stability and resistance to humidity.

A ¹⁵¹ One¹⁵² method for forming a graded¹⁵³ gradient¹⁵⁴ index plastic optical material¹⁵⁵ article according to the invention¹⁵⁶ comprises the steps of: (a) providing¹⁵⁷ forming¹⁵⁸ a transparent tube of sheathing material comprising¹⁵⁹ including at least one¹⁶⁰ sheathing polymer and a at least one¹⁶¹ sheathing dopant¹⁶²; and (b) forming a transparent core within the sheathing tube produced in step (a) by: (i) filling the interior space of the sheathing tube¹⁶³ with a core solution comprising a core¹⁶⁴ including at least one¹⁶⁵ polymerizable core¹⁶⁶ monomer which upon polymerization has a refractive index

4 ¹⁶⁷ greater than that of the sheathing tube; and + ¹⁶⁸ ii) allowing the ~~core~~
¹⁶⁹ polymerizable core ¹⁷⁰ monomer to polymerize thereby forming a
~~polymer~~ ¹⁷¹ polymeric core ¹⁷² having a refractive index greater than that of the
sheathing tube such that the ~~material~~ ¹⁷³ article ¹⁷⁴ is suitable to conduct light ¹⁷⁵
at at least one wavelength with an attenuation less than 500 dB/km. ¹⁷⁶ The core
solution can ~~comprise~~ ¹⁷⁷ include ¹⁷⁸ an optional core dopant. When present, the
core dopant will have a refractive index greater than that of the polymer
obtained upon polymerization of the ¹⁷⁹ a ¹⁸⁰ core monomer ¹⁸¹ solution polymerized
under the same conditions but not including the core dopant. ¹⁸² The product thus
obtained, is a ~~graded~~ ¹⁸³ gradient ¹⁸⁴ index plastic optical ~~material~~ ¹⁸⁵ article ¹⁸⁶
having an outer ~~transparent~~ ¹⁸⁷ sheathing and an inner core both at least
partially ¹⁸⁸ transparent core. ¹⁸⁹ to light at at least one wavelength. ¹⁹⁰ The
refractive index of the central axis of the ¹⁹¹ core is ¹⁹² will be ¹⁹³ greater than
that of the sheathing such that the ~~material~~ ¹⁹⁴ article ¹⁹⁵ is suitable to conduct
light at at least one wavelength with an attenuation less than about 500
dB/km ¹⁹⁶, with the refractive index of the core preferably ¹⁹⁷ gradually decreasing
in a radial direction from the ~~center~~ ¹⁹⁸ central axis ¹⁹⁹ of the core to the
periphery ²⁰⁰ of the core at the core-sheathing interface. ²⁰¹ In general, the
~~material~~ ²⁰² article ²⁰³ is fabricated ²⁰⁴ in the shape of a preform rod. Preferably,
the preform rod has a cylindrical shape which can be drawn into fibers.

In a ~~preferred~~ ²⁰⁵ one ²⁰⁶ embodiment, the sheathing tube is made by extrusion
methods. Alternatively, the sheathing tube can be produced by: (a) placing into
a polymerization container a sheathing solution ~~comprising a~~ ²⁰⁷ including at least
one ²⁰⁸ sheathing polymerizable monomer and a ²⁰⁹ at least one ²¹⁰ sheathing dopant,
the sheathing dopant having a refractive index lower than that of the polymer
obtained by the polymerization of the ²¹¹ a ²¹² sheathing monomer solution under the
same conditions but not including the sheathing dopant ²¹³; and (b) causing the
sheathing monomer of the sheathing solution to polymerize within the
polymerization container ~~in~~ ²¹⁴ into ²¹⁵ a cylindrical configuration ~~to form a~~
~~transparent~~ ²¹⁶ sheathing tube ²¹⁷ at least partially transparent to light at
at least one wavelength. ²¹⁸ The invention further provides a method for forming
a ~~graded~~ ²¹⁹ gradient ²²⁰ index plastic optical fiber. ~~The graded~~ ²²¹ In the method, the
gradient ²²² index plastic optical ~~material~~ ²²³ article ²²⁴ is prepared, for example ²²⁵
as described above, in the shape of a preform rod which ~~can~~ ²²⁶ is ²²⁷ then be
subjected to hot-drawing at a ~~temperature and speed~~ ²²⁸

5 ²²⁹ suitable to render the fiber useful as an optical conductor. ²³⁰ predetermined
temperature and speed suitable to produce a fiber useful as an optical
conductor. In one embodiment, the monomer of the sheathing solution and the
monomer of the core solution are the same. Suitable monomers include those which
form polymers that are substantially amorphous and capable of conducting light
at the desired wavelength(s). For embodiments where the core polymer and the
sheathing polymer are the same, when a core dopant is used it will be different
from the sheathing dopant. ²³¹

In another aspect gradient index plastic optical articles of the invention
comprise: (a) a polymeric sheathing that is at least partially transparent to
light at at least one wavelength including at least one sheathing polymer and at

least one sheathing dopant, where the sheathing dopant has a refractive index which is less than that of the sheathing polymer; and (b) a polymeric core, coaxially disposed within the sheathing, including at least one core polymer and having a refractive index at the central axis of the core greater than that of the polymeric sheathing. In some embodiments, the polymeric core further includes at least one core dopant, the core dopant, when present, having a refractive index which is greater than that of the core polymer. In preferred embodiments, the core dopant has a concentration gradient in a specific direction.²³²

In a certain embodiment, the monomer of the sheathing solution and the monomer of the core solution are the same.²³³ Suitable monomers include those which form polymers that are substantially amorphous and capable of conducting light in the desired wavelength. In this embodiment, when a core dopant is used it will be different from the sheathing dopant.²³⁴

The graded index plastic optical material of the invention comprises (a) a transparent sheathing comprising a sheathing polymer and a sheathing dopant, wherein²³⁵ some embodiments, the plastic optical article is in the shape of a cylindrical preform rod. In other embodiments, the article is in the shape of a cylindrical fiber having an outer diameter preferably between about 0.1 millimeter and about 1 millimeter.²³⁶

In yet another aspect, the invention involves a gradient index plastic optical article with a polymeric sheathing and a polymeric core. The polymeric sheathing is at least partially transparent to at least one wavelength of light and includes a sheathing polymer and a sheathing dopant, where²³⁷ the sheathing dopant has a refractive index which is less than that of the sheathing polymer; and (b) a transparent core,²³⁸ an equivalent polymeric sheathing without the sheathing dopant. The polymeric core of the article is coaxially²³⁹ disposed within the sheathing, comprising a core polymer having a refractive index greater than that of the sheathing and an optional core dopant, the core dopant, when present, having a refractive index which is greater than that of the core polymer; wherein the core dopant has²⁴⁰ a concentration gradient in a specific direction. The refractive index of the core is greater than that of the doped sheathing.²⁴¹

In a preferred embodiment, the material is in the²⁴² shape of a cylindrical preform rod. In another application²⁴³ the material is in the shape of a cylindrical fiber having an outer diameter between about 0.2 millimeters and about 1 millimeter.²⁴⁴ is at least partially transparent to at least one wavelength of light and includes a core polymer. The polymeric core also has a gradient in refractive index in a specific direction.²⁴⁵

In another aspect, the invention provides a method for forming a gradient index plastic optical article. The method involves forming a tube of polymeric sheathing material that is at least partially transparent to at least one wavelength of light from at least one polymerizable sheathing monomer and a sheathing dopant. A polymeric core that is at least partially transparent to at least one wavelength of light is then formed within the tube by filling the tube with a composition including at least one polymerizable core monomer and polymerizing the monomer. The polymeric core thus formed has a gradient in refractive index in a specific direction.²⁴⁶

The invention also involves a gradient index plastic optical article which has a polymeric sheathing that includes a sheathing dopant.²⁴⁷

In another aspect, the invention involves a gradient index plastic optical article with a polymeric sheathing and a polymeric core. The polymeric

sheathing is at least partially transparent to at least one wavelength of light and includes a sheathing polymer. The polymeric core of the article is coaxially disposed within the sheathing, is at least partially transparent to at least one wavelength of light and includes a core polymer and a specific overall concentration of a core dopant that has a refractive index greater than that of the core polymer. Furthermore, the core dopant has a concentration gradient within the core in a specific direction. The polymeric sheathing of the article is constructed and arranged so that the difference in refractive indices between the central axis of the polymeric core and the polymeric sheathing exceeds the difference in refractive indices between the central axis of the polymeric core and the sheathing polymer.²⁴⁸

In one aspect, the invention involves a gradient index plastic optical article with a polymeric sheathing and a polymeric core. The polymeric sheathing is at least partially transparent to at least one wavelength of light and includes a sheathing polymer. The polymeric core of the article is coaxially disposed within the sheathing, is at least partially transparent to at least one wavelength of light and includes a core polymer and a core dopant that has a refractive index greater than that of the core polymer. The core dopant is present in the polymeric core at a first overall concentration sufficient to create a difference in refractive indices between the central axis of the core and the sheathing of a desired value. In addition, the core dopant has a concentration gradient within the core in a specific direction. The polymeric sheathing of the article is constructed and arranged so that the maximum service temperature of the article exceeds that of an equivalent article except having a sheathing comprised of only sheathing polymer and having a second overall core dopant concentration required to create a difference in refractive indices between the central axis of the core and the sheathing equal to the same desired value. In general, this increase in the permissible service temperature for articles manufactured according to the present invention having a particular difference in refractive indices between core and sheathing is enabled by the ability to use a lower amount of core dopant in order to create the desired difference in refractive indices.²⁴⁹

In yet another aspect, the invention involves a gradient index plastic optical article with a polymeric sheathing and a polymeric core. The polymeric sheathing is at least partially transparent to at least one wavelength of light and includes a sheathing polymer. The polymeric core of the article is coaxially disposed within the sheathing, is at least partially transparent to at least one wavelength of light and includes a core polymer and a core dopant that has a refractive index greater than that of the core polymer. The core dopant is present in the polymeric core at a first overall concentration sufficient to create a difference in refractive indices between the central axis of the core and the sheathing of a desired value. Furthermore, the core dopant has a concentration gradient within the core in a specific direction. The polymeric sheathing of the article is constructed and arranged so that at least one wavelength of light is conducted by the article with less attenuation than by an equivalent article except having a sheathing comprised of only sheathing polymer and having a second overall core dopant concentration required to create a difference in refractive indices between the central axis of the core and the sheathing equal to the same desired value.²⁵⁰

In one aspect, the invention involves an optical preform article. The preform includes a polymeric sheathing, which is at least partially transparent to at least one wavelength of light and has a refractive index of a first value at that wavelength. The polymeric sheathing includes a sheathing polymer and a plasticizer. The preform also includes a polymeric core, which includes a core polymer, that is coaxially disposed within the sheathing and is at least

partially transparent to the same wavelength(s) of light as the polymeric sheathing, and which has a refractive index of a second value at the central axis of the core at that wavelength. The preform is fabricated so that the second value of refractive index (i.e. at the central axis of the polymeric core) exceeds the first value (i.e. of the sheathing).²⁵¹

In another aspect, the invention involves a method for making a plurality of optical preform articles. The method involves forming a plurality of polymeric sheathings, each of which includes a sheathing polymer, is at least partially transparent to at least one wavelength of light, and has a refractive index of a first value at that wavelength. The method also involves forming a plurality of polymeric cores, each of which includes a core polymer, that is coaxially disposed within the sheathing and is at least partially transparent to the same wavelength(s) of light as the polymeric sheathing, and which has a refractive index of a second value at the central axis at that wavelength that exceeds the first value of the sheathing. The region of contact between the sheathings and the cores thus formed defines a plurality of interfaces, with essentially all of the plurality of interfaces being essentially free of visible bubbles. In other words, the invention enables a large number of preforms to be made, each of which is essentially free of visible bubbles along its entire "as polymerized" length (e.g. without cutting the preform after polymerization).²⁵²

In another embodiment, the invention involves an optical preform article. The preform includes a polymeric sheathing, which includes a sheathing polymer, that is at least partially transparent to at least one wavelength of light and has a refractive index of a first value at that wavelength. The preform also includes a polymeric core that is coaxially disposed within the sheathing and is at least partially transparent to the same wavelength(s) of light as the polymeric sheathing, and which has a refractive index of a second value at the central axis of the core at that wavelength that exceeds the first value of the sheathing. The polymeric core includes a core polymer and a core dopant having a refractive index which is greater than that of the core polymer. The core dopant is present in the polymeric core at a specified overall concentration. Furthermore, the second value of refractive index (i.e. of the central axis of the polymeric core) exceeds the first value (i.e. of the polymeric sheathing) by at least 0.01, with the specified overall core dopant concentration not exceeding 12 %wt.²⁵³

In another aspect, the invention involves a plastic optical article. The article comprises a polymeric sheathing, which is at least partially transparent to at least one wavelength of light and a polymeric core, coaxially disposed within the sheathing, which is also at least partially transparent to the same wavelength of light. The polymeric sheathing includes a sheathing polymer, and the polymeric core includes a core polymer and a core dopant that has a refractive index greater than that of the core polymer. The refractive index of the central axis of the polymeric core has a value at the wavelength of light mentioned above that exceeds the refractive index of the polymeric sheathing at the same wavelength by at least 0.01. Furthermore, the maximum service temperature of the article is at least 40 degrees C, preferably 45 degrees C, and more preferably 50 degrees C.²⁵⁴

In yet another aspect, the invention provides a method for making a gradient plastic optical fiber. The method involves first forming a polymeric preform rod comprising a polymeric sheathing and a polymeric core coaxially disposed within the sheathing that has a gradient in refractive index in a specified direction. The preform is then hot-drawn at a rate of at least 3 m/min, preferably at least 4 m/min, and more preferably, at least 5 m/min, into

a fiber. The fiber thus produced conducts at least one wavelength of light with an attenuation less than 500 dB/km.²⁵⁵

BRIEF DESCRIPTION OF THE DRAWINGS

Figure 1 depicts a preferred²⁵⁶ shows one²⁵⁷ embodiment of a graded²⁵⁸ gradient index plastic optical material producible by the process of²⁶⁰ article according to²⁶¹ the invention.^{262 263}

Figure 2 is a graph showing the relationship between the transmission loss (attenuation)²⁶⁴ and wavelength of light for²⁶⁵ an optical fiber. The²⁶⁶ according to the invention;²⁶⁷ transmission loss was measured using standard²⁶⁸

~~techniques as described herein.~~²⁶⁹ Transmission²⁷⁰ loss at 650 nm was approximately 140 dB/km demonstrating that the optical fiber had a high level of transparency.

DETAILED DESCRIPTION OF THE INVENTION

The features and other details of the invention will now be more particularly described and pointed out below as well as²⁷¹ in the claims.²⁷² detailed description and examples below.²⁷³ It will be understood that the particular embodiments of the invention are shown by way of illustration only²⁷⁴ and are²⁷⁵ not intended to act²⁷⁶ as limitations of the invention. The principle features of this invention can be employed in various embodiments not specifically described herein²⁷⁷ without departing from the spirit and²⁷⁸ scope of the invention.

In one aspect, the invention provides a method for forming a graded²⁷⁹ gradient²⁸⁰ index plastic optical material comprising²⁸¹ article including²⁸² the steps of: (a) forming a transparent tube of sheathing material by²⁸³ tube of polymeric sheathing material that is at least partially transparent to light at at least one wavelength by:²⁸⁴ (i) placing into a polymerization container a sheathing solution comprising a sheathing polymerizable monomer and a sheathing dopant, wherein the sheathing dopant has a refractive index lower than that of the²⁸⁵ polymer obtained by the polymerization of the sheathing monomer²⁸⁶ including at least one polymerizable sheathing monomer and a plasticizer and/or dopant²⁸⁷; and (ii) causing the sheathing monomer of the sheathing solution to polymerize within the polymerization container to give an inner cylindrical configuration in the form of a transparent sheathing tube; and (b) forming a²⁸⁸ transparent eere²⁸⁹ form a polymeric sheathing tube at least partially transparent to light at at least one wavelength; and (b) forming a polymeric core coaxially disposed²⁹⁰ within the polymeric²⁹¹ sheathing tube produced in step (a) by: (i) filling the interior space of the sheathing tube with a core solution comprising a eere²⁹² including at least one²⁹³ polymerizable core²⁹⁴ monomer,²⁹⁵ which upon polymerization produces a polymeric core which²⁹⁶ has a refractive index greater than that of the polymeric²⁹⁷ sheathing tube; and (ii) allowing the core polymerizable monomer to polymerize thereby forming a polymer having a refractive index greater than that of the sheathing tube such that the material is suitable to conduct light.^{298 299} The core solution can comprise an optional eere dopant.³⁰⁰ further include a core dopant.³⁰¹ When present, the core dopant

will have, for most embodiments, a refractive index greater than that of the polymer obtained upon polymerization of the core monomer (i.e. without addition of the dopant).³⁰²

³⁰³
a

³⁰⁴
- will have a refractive index greater than that of the polymer obtained upon polymerization of the core monomer.³⁰⁵

The product thus obtained, is a graded index plastic optical material having an outer transparent sheathing³⁰⁶

In other aspects of the invention, the dopant included in the polymeric sheathing acts as a plasticizer, thus improving the mechanical properties of the polymeric sheathing. In other embodiments, a plasticizer which does not provide a desirable dopant effect but which yields desirable mechanical properties may be used, or a dopant which does not act as a plasticizer may be used, or a combination of a dopant and a plasticizer may be used. In some preferred embodiments, the plasticizer added to the sheathing further can act as a dopant which raises or lowers the refractive index of the polymeric sheathing when compared to polymerized sheathing monomer not including the plasticizer. For embodiments involving conducting light within a rod or fiber fabricated according to the invention, preferably the sheathing dopant lowers the refractive index of the polymeric sheathing.³⁰⁷

The terms "polymeric sheathing" and "polymeric core" as used herein refer to the polymerized sheathing and core solutions respectively, which include the polymerized sheathing and core monomers respectively (along with any agents involved with the polymerization reaction such as initiators, and chain transfer agents); plus, any added plasticizers and/or dopants, which do not participate in the polymerization reaction of the monomers. The terms "sheathing polymer" and "core polymer" as used herein, refer to the polymerized sheathing and core monomers respectively (along with any agents involved with the polymerization reaction such as initiators, and chain transfer agents), except polymerized without any plasticizers and/or dopants, which do not participate in the polymerization reaction of the monomers. "Sheathing polymer" and "core polymer" as used herein, may include homopolymers, copolymers, mixtures of homopolymers, mixtures of copolymers, mixtures of homopolymers and copolymers, and the like. A "dopant" as used herein, refers to any material or mixture of materials, which does not participate in the polymerization reaction and which is not covalently incorporated into the polymeric structure, but which has at least limited miscibility within the structure, so that when present, it alters the effective refractive index of the polymeric structure versus the refractive index of an equivalent polymer, but not containing the dopant, by at least 0.0001. A "plasticizer" as used herein, refers to any material or mixture of materials, which does not participate in the polymerization reaction and is not covalently incorporated into the polymeric structure, but which has at least limited miscibility within the structure, so that when present, it decreases the glass transition temperature of the polymeric structure versus that of an equivalent polymer, but not containing the plasticizer, by at least 1 %. It should also be understood that "plasticizers" and "dopants" as used herein also can include unreacted monomer, or unreacted agents typically used in conjunction with a polymerization reaction such as unreacted initiators, and unreacted chain transfer agents. Suitable dopants or plasticizers may be solids, liquids, or gases at room temperature and pressure.³⁰⁸

The phrase "transparent" or "at least partially transparent" as used herein, refers to the ability transmit or conduct a finite quantity of light energy (greater than zero) of at least one wavelength, over a finite, non-zero, distance. The term "coaxially" or "coaxial" as used herein to describe the structure of certain optical articles according to the invention, refers to an elongated cylindrical core having a central longitudinal axis, which is concentrically surrounded by, and in at least partial physical contact with, an outer annular sheathing, which shares the central longitudinal axis with the core, and is physically and/or chemically distinct from the core. The region of contact between the core and the sheathing is herein referred to as an "interface."³⁰⁹

Preferred products obtained by the methods of the invention include gradient index plastic optical articles having an outer transparent polymeric sheathing³¹⁰ layer and an inner transparent polymeric³¹¹ core. The refractive index of the core is greater than that of the sheathing such that the material³¹² article³¹³ is suitable to conduct light, with the refractive index of the core gradually decreasing in a radial direction from the center of the core³¹⁴ having a gradient in a specific direction. The term "refractive index" as used herein, refers specifically to the refractive index of the material at the wavelength, or wavelengths, of light being transmitted. When there may exist more than one index of refraction at a given wavelength within a material depending on the spatial location within the material where the index is measured, unless a specific spatial location is specified, the term "index of refraction" refers to the maximum index of refraction within the material. The phrase "gradient in a specific direction" as used herein, refers to a continuous change in a property in a radial direction either from the central axis³¹⁵ to the periphery. In general, the material is³¹⁶ periphery or vice versa. For preferred optical articles according to the invention, the core has a gradient in refractive index such that the refractive index is highest at the central axis of the core and decreases in the direction of the interface between the core and sheathing. However in other specific embodiments, the gradient may be in the opposite direction. In general, the articles are initially produced³¹⁷ in the shape of a preform rod, as shown in Figure 1, where the transparent sheathing is depicted as component 1 and the core is depicted as component 2. Preferably, the preform rod has a circular³¹⁸ cylindrical shape. The method also provides³¹⁹ The methods of the present invention also provide³²⁰ for forming a graded³²¹ gradient³²² index plastic optical fiber. This comprises formation of a graded index plastic optical material, for example, as described above, in the shape of a preform rod followed by hot-drawing of the preform³²³, preferably with an outer diameter not more than 1 millimeter and with the same general cylindrical shape of the preform but with a smaller diameter. To form an optical fiber from a preform rod, the preform can be subjected to hot-drawing³²⁴ at a temperature and speed suitable to render the fiber useful as an optical conductor. The novel addition of a plasticizer to the polymeric sheathing according to one aspect of the invention, provides improved mechanical properties of the preform article which enable faster hot-drawing speeds than previously attainable. For example, preforms, according to the invention, may be formed into an optical fiber able to conduct light at at least one wavelength with an attenuation less than 500 dB/km, and preferably less than 200 dB/km, by hot drawing at a drawing speed of at least 3 m/min, preferably at least 4 m/min, more preferably at least 5 m/min, and even more preferably at least 6

m/min. Alternatively, instead of formation of the optical fiber by hot drawing, the fiber may be produced by extrusion.³²⁵

The term "preform rod" as used herein ~~is the~~³²⁶, refers to a³²⁷ rod shaped ~~form of the graded~~³²⁸ gradient³²⁹ index plastic optical material article³³⁰ that can subsequently³³² ~~be produced according to the method of the~~ present ~~invention.~~³³³ In general, the rod can be further³³⁴ processed into an optical conductor such as an optical fiber, an optical waveguide,³³⁵ or an optical integrated circuit. ~~For example, after the preform rod is produced, it can be removed from the polymerization container and formed into a~~³³⁶ plastic optical fiber. This can be accomplished, for example, by hot drawing of the preform. Other known fiber producing techniques, for example, extrusion can also be employed.³³⁷

The polymerization container used in the method of the ~~35~~³³⁸ invention can be composed of any material which is inert to

~~8~~³³⁹ the sheathing solution, for example, glass. The container shape and dimensions will determine the outer shape of the ~~graded~~³⁴⁰ gradient³⁴¹ index plastic optical material ~~preform article~~³⁴² ultimately obtained in the practice of ~~by~~³⁴⁴ the method. ~~A~~³⁴⁵ The³⁴⁶ sheathing tube is ~~can be~~³⁴⁸ produced³⁴⁹ ~~by~~³⁵⁰ using the well known technique of rotation casting, by placing a sheathing solution in the polymerization container and causing the solution to polymerize within the container ~~to give an inner~~³⁵² while the container is rotated to yield an annular³⁵³ cylindrical configuration. ~~shape.~~³⁵⁴ shape.³⁵⁵ Thus, the polymerization container can be any shape which when rotated about its own axis creates a sheathing tube with an inner³⁵⁶ annular³⁵⁷ cylindrical configuration. ~~shape.~~³⁵⁸ shape.³⁵⁹ The preferred shape of the container is cylindrical,³⁶⁰ a circular cylinder³⁶¹ preferably with dimensions that ~~can achieve a preform rod~~³⁶² suitable for hot-drawing into an optical fiber.³⁶³

~~The sheathing of the graded index optical material is the outer layer of the material. The sheathing is prepared using the well known technique of rotation casting, by placing into a polymerization container a sheathing solution comprising a sheathing polymerizable monomer and a~~³⁶⁴ ~~sheathing dopant and causing the sheathing polymerizable monomer of the sheathing solution to polymerize within the container in a cylindrical configuration. The sheathing dopant does not participate in the polymerization reaction. Polymerization of the monomer into a cylindrical~~³⁶⁵ ~~configuration can be accomplished by, for example, rotating the polymerization container about its own axis, during polymerization.~~³⁶⁶ , for example, with an inner diameter between 0.25 and 2 inches.³⁶⁷ The centrifugal force resulting from the rotation of the polymerization container³⁶⁸ will cause the resulting polymer to form a tube of sheathing material or a sheathing tube within the polymerization container. Rotation can be accomplished, for example, by spinning the container.

~~Alternatively, the sheathing can also be prepared by extrusion of the doped sheathing polymer into tubular shapes using extrusion methods which are well known to~~³⁶⁹

~~those of skill in the art. The outer and inner shape of~~³⁷⁰

~~the sheathing in this method will be dictated by the shape of the extrusion dye. The extruded sheathing will then serve as the container into which the core solution will be added and allowed to polymerize.~~³⁷² The amount of sheathing=forming³⁷³ solution placed in the polymerization container can be determined based upon the ratio of the thickness of the sheathing wall to the distance between the opposing interior walls of the sheathing,³⁷⁴ which is desired. This ratio will depend upon the cost of materials and the end use of the optical material.³⁷⁵ article³⁷⁶.

Alternatively, the sheathing can also be prepared by extrusion of the sheathing polymer, together with any additives such as plasticizers and/or dopants, into tubular shapes using extrusion methods which are well known to those of skill in the art. The outer and inner shape of the sheathing using this method will be dictated by the shape of the extrusion dye.³⁷⁸ The extruded sheathing will then serve as the container into which the core-forming solution will be added and allowed to polymerize.³⁷⁹

The polymerizable sheathing monomer can be any monomer or mixture of monomers³⁸⁰ which upon polymerization yields substantially amorphous and transparent polymeric materials. Preferably, the polymeric materials of the sheathing are at least partially soluble in the monomer present in the core=forming³⁸¹ solution and exhibit a suitable miscibility with the sheathing dopant and/or plasticizer³⁸².

Polymerizable monomers suitable for use in this invention include, but are not limited to,³⁸³ for example, methacrylate monomers such as branched and unbranched C₁-C₁₀³⁸⁴ alkyl methacrylates, for example, methyl methacrylate, ethyl methacrylate, n-propyl methacrylate, n-butyl methacrylate, n-hexyl methacrylate, isopropyl methacrylate, isobutyl methacrylate, tert-butyl methacrylate; halogenated methacrylates, such as 2,2,2-trifluoroethyl methacrylate; 4-methyl cyclohexyl methacrylate, cyclohexyl methacrylate, furfuryl methacrylate,³⁸⁶ 1-phenylethyl methacrylate, 2-phenylethyl methacrylate, 1-³⁸⁷phenylcyclohexyl methacrylate, benzyl methacrylate and phenyl methacrylate; acrylate monomers such as, methyl acrylate, ethyl acrylate, n-butyl acrylate, benzyl acrylate, 2-chloroethyl acrylate, methyl-a-chloro acrylate, 2,2,3,3-tetrafluoropropyl-a-fluoro acrylate, and 2,2,2-³⁸⁸trifluoroethyl acrylate; acrylonitrile and a-³⁸⁹methylacrylonitrile; vinyl monomers,³⁹⁰ such as³⁹¹ vinyl acetate,

-10³⁹² vinyl benzoate, vinyl phenylacetate, vinyl chloroacetate; styrene monomers,³⁹³ such as³⁹⁴ styrene, halogenated styrenes, for example, o-chlorostyrene, p-fluorostyrene, o,p-difluorostyrene³⁹⁵ p-difluorostyrene³⁹⁶, and p-isopropyl styrene; and³⁹⁷ perfluorinated monomers such as 2,2-bis(trifluoromethyl)-4,5-difluoro-1,3-dioxole also known as³⁹⁸ monomers such as those disclosed in European Patent Application EP 0710 855 herein incorporated by reference. Such monomers include, but are not limited to³⁹⁹ perfluoro(2,2-dimethyl-1,3-dioxole) (PDD), perfluoro(allyl vinyl ether), perfluoro(butenyl vinyl ether)⁴⁰⁰ and any combination of monomers thereof. When a combination of monomers is employed polymerization will result in formation of a copolymer.

A sheathing plasticizer or⁴⁰¹ dopant suitable for use in the methods of the invention is one which does not participate in the chemical⁴⁰² reaction

which polymerizes the sheathing monomer. A suitable⁴⁰³ preferred⁴⁰⁴ sheathing dopant will have a refractive index which is lower than that of the sheathing⁴⁰⁵ polymer obtained upon polymerization of the sheathing monomer of the sheathing solution.⁴⁰⁶ sheathing monomer in a manner essentially identical to that employed for forming the polymeric sheathing except without the presence of the dopant. In other words, the sheathing dopant is selected so that the polymeric sheathing containing the sheathing dopant will have a lower refractive index than an equivalent polymeric sheathing except without the sheathing dopant by at least 0.0001, and preferably by at least 0.0005.⁴⁰⁷ In addition, the sheathing dopant must not compromise the⁴⁰⁸ should not unduly reduce the degree of⁴⁰⁹ transparency of the polymer⁴¹⁰ polymeric sheathing⁴¹¹ obtained upon polymerization of the sheathing monomer.⁴¹² solution.⁴¹³ The level of transparency is inversely related to the transmission loss (i.e. attenuation)⁴¹⁴ of a graded⁴¹⁵ gradient⁴¹⁶ index plastic optical conductor in⁴¹⁷ at⁴¹⁸ the operating wavelength of the conductor, and can be assessed using techniques well⁴¹⁹ known to those of skill in the art. For example, a graded⁴²⁰ gradient⁴²¹ index plastic optical fiber which has a transmission loss⁴²² lose⁴²³ value of 110 dB/km at an operating wavelength of 650 nm, possesses an adequate level of transparency as an optical conductor. However, a loss of more than 500 dB/km would not be an acceptable level of transparency. Therefore, a graded⁴²⁴ gradient⁴²⁵ index optical material⁴²⁶ article⁴²⁷ is suitably⁴²⁸ transparent when an optical conductor, prepared from the material⁴²⁹ article⁴³⁰, has a transmission loss⁴³¹ lose⁴³², also known as the attenuation, in⁴³³ for⁴³⁴ the operating wavelength of the conductor less than 500 dB/km. Figure 2 depicts the transmission loss of an optical fiber prepared using the method of the invention as described herein in Example 1. The loss was measured using methods known in the art such as those described in "Test Method for Attenuation of All Plastic Multimode Optical⁴³⁵ optical⁴³⁶ Fibers JIS C 6863-(1990)," Japanese Industrial Standard by the Japanese Standards Association,⁴³⁷ herein incorporated by reference.⁴³⁸ Figure 2 shows a transmission loss of 140 dB/km at a wavelength of 650 nm. ~~This transmission loss provides a~~⁴³⁹ fiber with a suitable level of transparency.⁴⁴⁰

One useful criterion, for predicting whether or not the sheathing will be sufficiently⁴⁴¹ transparent, is predicated on the Flory-Huggins interaction parameter, χ_{AB} ⁴⁴² ?AB⁴⁴³. That is, χ_{AB} ⁴⁴⁴ ?AB⁴⁴⁵ can be used as a guide to the likelihood⁴⁴⁶ degree⁴⁴⁷ of miscibility between substances A and B, which in this case would be sheathing polymer and sheathing plasticizer and/or⁴⁴⁸ dopant. The blend miscibility can be assumed to decrease with increasing values of ?AB. This parameter can be determined experimentally or approximated according to the following equation:

6, ⁴⁴⁹ where d ⁴⁵⁰ is the solubility parameter which is a thermodynamic quantity generally defined as the square root of the cohesive energy density. ~~The~~⁴⁵¹ (the⁴⁵² cohesive energy density is obtained by dividing the molar evaporation energy, ΔE ⁴⁵³ ?E⁴⁵⁴, of a liquid by a molar volume, V ⁴⁵⁵ l⁴⁵⁶. V_{ref} is an appropriate reference volume.⁴⁵⁷ R is the ideal⁴⁵⁸ gas constant and T is the temperature.⁴⁶⁰ in degrees K.⁴⁶¹ A detailed discussion of the Flory-Huggins interaction parameter can be found in CRC Handbook of Polymer-Liquid Interaction Parameters and Solubility⁴⁶² Parameters, by A.F.M. Barton, 1990.⁴⁶³ 1990, herein incorporated by reference. Flory-Huggins interaction parameters below

about 0.5 generally indicate that a dopant or plasticizer may have suitable miscibility for use in the invention.⁴⁶⁴ However, the Flory-Huggins interaction parameter should be used only⁴⁶⁵ as a guide to the selection of an appropriate dopant or plasticizer⁴⁶⁶, but not as a limitation, since the concentration of the plasticizer or⁴⁶⁷ dopant is also an⁴⁶⁸ important criterion to consider in maintaining a⁴⁶⁹ in determining the transparency of the polymeric⁴⁷⁰ sheathing and core with an acceptable transparency⁴⁷¹.

Some examples of preferred⁴⁷² sheathing dopants suitable for use in the invention include, but are not limited to, diisobutyl

-12⁴⁷³ adipate, glycerol-triacetate, 2,2,4-trimethyl- 1,3-⁴⁷⁴ pentanediol diisobutyrate, methyl laurate, dimethyl sebatate, isopropyl myristate, diethyl succinate, diethyl phthalate, tributyl phosphate, dicyclohexyl phthalate, dibutyl sebatate, diisooctyl phthalate, dicapryl phthalate, diisodecyl phthalate, butyl, octyl phthalate, dicapryl adipate, perfluorinated aromatics, for example perfluoro naphthalene, perfluorinated ethers and perfluorinated polyethers. Typically⁴⁷⁵ Preferably⁴⁷⁶, the sheathing dopant is present in the sheathing at a⁴⁷⁷ an overall⁴⁷⁸ concentration of between about 1 and about 35 weight percent based on the total weight⁴⁷⁹ of the monomer of the⁴⁸⁰ polymeric⁴⁸¹ sheathing solution⁴⁸², more typically⁴⁸³ preferably⁴⁸⁴ between about 1 and about 20 weight percent⁴⁸⁵, and most typically⁴⁸⁶ preferably⁴⁸⁷ between about 1 and about 15 weight percent. In general, the⁴⁸⁸ preferred⁴⁸⁹ sheathing dopant⁴⁹⁰ dopants⁴⁹¹ can also⁴⁹² impart plasticizer-like qualities and/or hydrophobic properties upon the graded index plastic optical material.⁴⁹³ to the polymeric sheathing.⁴⁹⁴ The presence of plasticizer-like qualities and/or hydrophobic properties in the graded index plastic optical material of⁴⁹⁵ polymeric sheathing of⁴⁹⁶ the invention is advantageous. That is, plasticizer-like qualities allow the graded⁴⁹⁷ gradient⁴⁹⁸ index plastic optical material⁴⁹⁹ article⁵⁰⁰ to be hot-drawn at a lower temperature and a higher speed, which results⁵⁰¹ and also can result⁵⁰² in a fiber with an acceptable⁵⁰³ a lower⁵⁰⁴ level of attenuation or transmission loss compared to prior art fibers and methods⁵⁰⁵. Hydrophobic properties provide for an optical material⁵⁰⁶ article⁵⁰⁷ with enhanced environmental stability, for example,⁵⁰⁸ decreased moisture absorbency.

~~Any method of polymerization can be used in the method of the invention for forming the graded⁵⁰⁹~~ It should be emphasized that, in some embodiments, a plasticizer can be used to impart the desirable physical properties above that does not impart desired refractive index changes to the polymer. Such a plasticizer may advantageously be used alone when changes in refractive index are not needed or desired, or, in other embodiments, such plasticizers may be used together with a separate dopant. Any suitable plasticizer known in the art useful for plasticizing the polymers formed from the polymerizable monomers previously listed may potentially be employed in the present invention.⁵¹⁰

Suitable methods of polymerization for forming the gradient⁵¹¹ index plastic optical material. These methods⁵¹² article according to the invention⁵¹³ include, for example, free radical polymerization, atom transfer radical polymerization, anionic polymerization and cationic polymerization. Free radical bulk polymerization, employing either thermal or optical energy, is preferred.

When radical polymerization is employed, the sheathing solution also includes a radical polymerization initiator

⁵¹⁴ and a chain transfer agent ⁵¹⁵ which participate in the polymerization reaction. ⁵¹⁶ Suitable radical polymerization initiators are selected based on the type of energy employed in the polymerization reaction. For example, when heat or infrared polymerization ⁵¹⁷ energy ⁵¹⁸ is employed, ⁵¹⁹ peroxides such as lauryl peroxide, benzoyl peroxide, ~~t-butyl~~ ⁵²⁰ t-butyl ⁵²¹ peroxide and 2,5-dimethyl-2,5-di(2-ethyl hexanoyl peroxy)hexane (TBEC) are suitable for use. When ultraviolet polymerization ⁵²² light energy ⁵²³ is employed benzoin methyl ether (BME) or benzoyl peroxide is suitable for use. Typically, the polymerization initiator is present in the sheathing solution in a range of between about 0.1 to about 0.5 percent by weight ~~of the monomer~~ ⁵²⁴.

~~Any chain~~ ⁵²⁵ Chain ⁵²⁶ transfer agent ~~is~~ ⁵²⁷ agents ⁵²⁸ suitable for use in the method of the invention. ~~These~~ ⁵²⁹ include, but are not limited to, 1-butanethiol and 1-dodecanethiol. Typically, the chain transfer agent ~~is~~ ⁵³⁰ in ⁵³¹ present in the sheathing solution below about 0.5 percent by weight ~~of the monomer~~ ⁵³².

As described earlier, the polymerization container is rotated during polymerization of the monomer of the sheathing solution. This rotation, for example, ⁵³³ spinning, ~~provides~~ ⁵³⁴ will yield ⁵³⁵ a transparent sheathing tube having an inner ⁵³⁶ annular ⁵³⁷ cylindrical configuration. The interior space of this sheathing tube thereby provides a suitable container for polymerization of the core monomer in a subsequent step of the ~~elaimed~~ ⁵³⁸ inventive ⁵³⁹ method.

The core of the ~~graded~~ ⁵⁴⁰ gradient ⁵⁴¹ index plastic optical material ⁵⁴² article ⁵⁴³ is the inner layer of the material which is disposed within the sheathing. The core is transparent and ~~ultimately provides~~ ⁵⁴⁴ is ⁵⁴⁵ the component of the material ⁵⁴⁶ article ⁵⁴⁷ through which most of the ⁵⁴⁸ light travels. The refractive index of the central axis of the polymeric ⁵⁴⁹ core is preferably ⁵⁵⁰ greater than that ~~of the sheathing such the material is suitable to conduct light.~~ ⁵⁵¹ of the sheathing, and more preferably, the index of refraction throughout the bulk of the core is greater than that of the polymeric sheathing. ⁵⁵²

The core can be prepared by filling the sheathing tube with a core solution ⁵⁵³ ~~which comprises a core polymerizable monomer and an optional~~ ⁵⁵⁴ includes a polymerizable core monomer and, optionally, a ⁵⁵⁵ core dopant ⁵⁵⁶, and polymerizing the

~~core monomer.~~ ⁵⁵⁷ core monomer in the solution. ⁵⁵⁸ ~~The core~~ ⁵⁵⁹ polymerizable ⁵⁶⁰ polymerizable core ⁵⁶¹ monomer can be any monomer or mixture of monomers ⁵⁶² which upon polymerization yields substantially amorphous and transparent polymeric materials capable of conducting light ~~in~~ ⁵⁶³ at ⁵⁶⁴ the desired wavelength. In addition, the ~~core polymerizable monomer, upon polymerization,~~ ⁵⁶⁵ polymeric core, once formed, preferably ⁵⁶⁶ has a refractive index at its central axis ⁵⁶⁷ greater than that of the sheathing such that the material ⁵⁶⁸ final optical article ⁵⁶⁹ is suitable to conduct light. All of the monomers which are suitable for use in preparing the sheathing are, likewise, suitable for use in preparing the core. ~~A combination of monomers can also be~~

~~used in preparation of the core thereby providing a core comprising a copolymer-⁵⁷⁰ core.⁵⁷¹~~

~~As described earlier, any⁵⁷² Any⁵⁷³ method of polymerization is suitable for use in the method of the invention. When⁵⁷⁴ previously described as suitable for formation of the polymeric sheathing is also suitable for formation of the polymeric core. When⁵⁷⁵ radical polymerization is employed in preparation of the core,⁵⁷⁶ a polymerization initiator and chain transfer agent⁵⁷⁷ is present in the core solution in ranges⁵⁷⁸ with a concentration⁵⁷⁹ similar to those⁵⁸⁰ that⁵⁸¹ described earlier for the sheathing solution. Typically, the chain transfer agent is present below about 0.5 percent by weight of the⁵⁸² ⁵⁸³ monomer.⁵⁸⁴~~

~~A⁵⁸⁵ An optional⁵⁸⁶ core dopant suitable for use in the method of the invention⁵⁸⁷ is one which does not participate in the chemical⁵⁸⁸ reaction which polymerizes the core monomer and which preferably⁵⁸⁹ has a boiling point lower than the highest processing temperature to which it is subjected. A suitable core dopant will preferably⁵⁹⁰ have a refractive index which is greater than that of the core⁵⁹¹ polymer obtained upon polymerization of the⁵⁹² of a⁵⁹³ core monomer solution without the core dopant⁵⁹⁴. In addition, the⁵⁹⁵ preferred⁵⁹⁶ core dopant must⁵⁹⁷ dopants should⁵⁹⁸ not compromise⁵⁹⁹ unduly reduce⁶⁰⁰ the transparency of the polymer obtained upon polymerization of the⁶⁰¹ ⁶⁰² polymeric core monomer⁶⁰³ ⁶⁰⁴. As in the preparation of the sheathing, one useful criterion for predicting whether or not the core will be sufficiently⁶⁰⁵ transparent is predicated on the Flory-Huggins interaction parameter,⁶⁰⁶ between the core polymer and the core dopant. However, as discussed earlier this parameter should be used only as a guide not a limitation⁶⁰⁷ when~~

~~-15⁶⁰⁸ choosing a suitable core dopant, since the concentration of the dopant also needs to be considered⁶⁰⁹ affects the polymeric core transparency⁶¹⁰.~~

~~Compounds suitable for use as the core dopant in the method of the invention include, but are not limited to, dibenzyl ether, phenoxy toluene, 1,1-bis-(3,4-dimethyl phenyl) ethane, diphenyl ether, biphenyl, diphenyl sulfide, diphenylmethane, benzyl phthalate-n-butyl, 1-methoxyphenyl-⁶¹¹ 1-phenylethane, benzyl benzoate, bromobenzene, edichlorobenzene⁶¹² o-dichlorobenzene⁶¹³, m-dichlorobenzene, 1,2-dibromomethane, 3-⁶¹⁴ phenyl-1⁶¹⁵ ⁶¹⁶ -propanol, dioctyl phthalate and perfluorinated aromatics, such as, perfluoro naphthalene.~~

~~When the core solution, which comprises⁶¹⁷ includes⁶¹⁸ the core monomer and an optional core dopant, is added to the sheathing tube, the inner surface of the sheathing tube⁶¹⁹ is slightly swollen by the core monomer. As a result⁶²⁰ During the polymerization⁶²¹, a gel phase is formed on⁶²² in the polymerizing core adjacent to⁶²³ the inner wall of the sheathing tube. The concentration of the polymer in the swollen phase layer is not uniform, in that the concentration of the polymer and sheathing dopant, eluted from the sheathing, gradually⁶²⁴ which gradually moves toward the central axis as the polymerization process progresses. Since the diffusivity of the core dopant is higher in the unpolymerized core solution than in the gel phase or the polymerized regions of the core, there is a net migration of core dopant towards the central axis of the core during the polymerization, so that when polymerization is complete,~~

there is a concentration gradient of core dopant in the direction from the central axis (highest concentration) towards the interface with the sheathing (lowest concentration). In contrast, the sheathing dopant, some of which can elute from the sheathing and diffuse into the core during polymerization, will have a concentration within the polymerized core which is highest at the core-sheathing interface and which gradually⁶²⁵ decreases with distance from the inner surface.⁶²⁶ interface towards the central axis of the core.⁶²⁷ Thus, a distributed concentration gradient⁶²⁹ of the low refractive index sheathing⁶³⁰ dopant is formed in the gel phase during polymerization⁶³¹ due to diffusion of sheathing dopant. Polymerization⁶³² from the polymeric sheathing. The polymerization front in the core⁶³³ starts from the vicinity of the inner surface of the sheathing (interface between sheathing and core)⁶³⁴ and gradually grows⁶³⁵ to⁶³⁶ moves⁶³⁷ towards the center axis of the tube⁶³⁸ core⁶³⁹ due to⁶⁴⁰ a phenomena of⁶⁴¹ accelerated polymerization in the gel stated⁶⁴² phase⁶⁴³ commonly known as the "gel-effect" (See⁶⁴⁴ For additional details, see⁶⁴⁵ for example, Koike, Y. et al., "High-Bandwidth⁶⁴⁶ High-Bandwidth⁶⁴⁷ Graded-Index Polymer Optical Fiber⁶⁴⁸", ⁶⁴⁹ Journal of Lightwave Technology, 13(7)⁶⁵⁰ 230⁶⁵¹): 1475-1489 (1995) and Koike, Y. et al., "New Interfacial-Gel Copolymerization Technique for Steric GRIN Polymer Optical Waveguide and Lens Arrays⁶⁵²", ⁶⁵³ Applied optics⁶⁵⁴ Optics⁶⁵⁵, 27(3): 486-491 (1988), both incorporated herein by reference⁶⁵⁶).

When⁶⁵⁷ As discussed above, when⁶⁵⁸ a core dopant, having a higher refractive index than the equivalent polymerized core monomer but without the core dopant,⁶⁵⁹ is present, a concentration gradient of the core dopant, which remains in⁶⁶⁰ within⁶⁶¹ the polymeric⁶⁶² core polymer⁶⁶³, is also⁶⁶⁴ formed. As described in U.S. Patent No.

L)⁶⁶⁵

-16⁶⁶⁶ 5,541,247 by Koike, incorporated herein by reference,⁶⁶⁷ the core monomer polymerizes while the substance with a greater refractive index (core dopant)⁶⁶⁸ becomes highly⁶⁶⁹ concentrated at⁶⁷⁰ towards⁶⁷¹ the center⁶⁷² central axis⁶⁷³ of the core. The high concentration of the core dopant which is present at the central part of the core gradually decreases in a radial direction toward the periphery, thereby, creating a gradient in a specific direction.⁶⁷⁴ core dopant concentration in a specific direction which creates a corresponding gradient in refractive index within the core. Notably, the specific direction of the concentration gradient of core dopant within the polymeric core will be opposite that of the concentration gradient of the sheathing dopant within the core.⁶⁷⁵

In a certain embodiment, the⁶⁷⁶ polymerizable⁶⁷⁷ monomer of the sheathing solution and the polymerizable⁶⁷⁸ monomer of the core solution are the same. Suitable⁶⁷⁹ In such cases, suitable⁶⁸⁰ monomers include those which form polymers that are substantially amorphous and transparent, thereby being capable of conducting light in⁶⁸¹ at⁶⁸² the desired wavelength, as earlier described. ~~when~~⁶⁸³ When⁶⁸⁴ the sheathing and core monomers are the same, and a core dopant is present, the sheathing dopants⁶⁸⁵ and core dopants will be different. That is, the sheathing dopant will have a refractive index which is less than that of the polymer obtained upon an equivalent⁶⁸⁶ polymerization of the⁶⁸⁷ a⁶⁸⁸ sheathing monomer solution without the sheathing dopant,⁶⁸⁹ while the core dopant will have a refractive index which is greater

than that of the polymer obtained upon an equivalent⁶⁹⁰ polymerization of the⁶⁹¹ a⁶⁹² core monomer. However⁶⁹³ solution without the core dopant. Preferably⁶⁹⁴, the difference in refractive index between the sheathing dopant and core dopant should have a value which renders the optical material⁶⁹⁵ article⁶⁹⁶ suitable to conduct light at at least one wavelength with an attenuation less than 500 dB/km⁶⁹⁷.

This difference in the refractive index could be, for⁶⁹⁸

Advantageously, through use of a low refractive index sheathing dopant according to one aspect of the invention, the overall concentration of core dopant required to provide a desired difference in refractive index between the central axis of the core and the sheathing will be less than for an equivalent optical article except having a sheathing which does not include the sheathing dopant. The term "overall concentration" as used herein, refers to the total amount of core dopant present in the polymeric core based on the total weight of the polymeric core. In short, the current invention provides plastic optical articles which require a lower overall concentration of core dopant to obtain comparable bandwidth capabilities when compared to similar prior art optical articles. The ability to use a lower overall core dopant concentration provides many advantages in the optical and physical properties of the articles as discussed below. As an example, if a desired difference in the refractive index between the central axis of the core and the sheathing is 0.001, this could be achieved according to the present invention, for example, by employing a core dopant which raises the refractive index the polymeric core by 0.0005 and a sheathing dopant which lowers the refractive index of the polymeric sheathing by 0.0005. The use of a low refractive index sheathing dopant according to the invention enables the fabrication of plastic optical articles having an unprecedented difference in the refractive indices of the central axis of the core and the sheathing. For example, according to the inventive methods, using a particular selection of dopants, a plastic optical preform can be fabricated with the difference in the refractive indices between the central axis of the core and the sheathing being at least 0.01 with an overall core dopant concentration not exceeding 12 %wt.⁶⁹⁹

example, 0.001 and be achieved by, for example, employing a core dopant with a refractive index greater than that of the core polymer by 0.0005 and a sheathing dopant with a refractive index less than of the sheathing polymer by 0.0005.⁷⁰⁰ Thus, the method of the invention employing sheathing dopants⁷⁰¹ has advantages over a method employing a dopant-free sheathing, in that for example,⁷⁰² a broader selection of materials which can employed as dopants is available, based on the additive effect of the core and sheathing dopant as opposed to the singular effect of the⁷⁰³ a⁷⁰⁴ core dopant alone⁷⁰⁵. Additionally, a lower concentration of

-17⁷⁰⁶ core⁷⁰⁷ dopant or no dopant at all can be used in the core and still achieve a comparable difference in refractive index.⁷⁰⁸ while still achieving a suitable difference in refractive indices. A reduction in the required concentration of core dopant can, for example, increase the transparency of the article and reduce attenuation when compared to an equivalent article except having a sheathing without the sheathing dopant, such article thus requiring a higher overall concentration of core dopant to create the same difference in refractive index between the central axis of the core and the sheathing. "Equivalent" as used herein in this context implies that all materials and polymerization conditions are the same for the articles being compared except

for the presence of a dopant or plasticizer. The reduction in core dopant concentration enabled by the present invention can also allow for an increased maximum service temperature for the article, since lower core dopant concentrations will typically correlate with higher glass transition temperatures for the polymeric cores. For example, the present invention can provide a plastic optical article comprising a polymeric sheathing and a polymeric core where the refractive index at the central axis of the core exceeds that of the sheathing (for the same wavelength) by at least 0.01, while the article has a maximum service temperature of at least 40 degrees C.⁷⁰⁹

In a specific embodiment, the monomer of⁷¹⁰ preferred embodiment, the monomer that is polymerized to form⁷¹¹ the core and the sheathing is methyl methacrylate. In this embodiment,⁷¹² when a core dopant is present, the sheathing and core dopants are different substances. The difference in the refractive index between the dopants must be such that the optical material is suitable to conduct light. Additionally, the refractive index of the core dopant is⁷¹³ greater than that of the sheathing dopant. For example, the dopant for the sheathing can be tributyl phosphate (refractive index = 1.424) while the dopant for the core can be diphenyl sulfide (refractive index = 1.6327).⁷¹⁴ In another embodiment, the monomer of the core and the⁷¹⁵ sheathing is 2,2-bis(trifluoromethyl)-4,5-difluoro-1,3-dioxole also known⁷¹⁶ another preferred embodiment, the monomer that is polymerized to form the core and the sheathing is a perfluorinated monomer such⁷¹⁷ as perfluoro(2,2-dimethyl-1,3⁷¹⁸ 1,3⁷¹⁹ -dioxole) (PDD). In this embodiment⁷²⁰ these embodiments⁷²¹, when a core dopant is present, the sheathing and core dopants are⁷²² plasticizer and/or dopant and core dopant are preferably⁷²³ different substances, with⁷²⁴ . For embodiments where the sheathing includes a sheathing dopant,⁷²⁵ the difference in the refractive index between the dopants⁷²⁶ dopants should be⁷²⁷ such that the optical material⁷²⁸ article⁷²⁹ is suitable to conduct light. Additionally, the refractive index of the core dopant is greater than that of the sheathing dopant.⁷³⁰

~~In yet another embodiment, the method of the invention further comprises the step of hot drawing the graded index~~⁷³¹ ~~optical preform into a fiber. Typically, hot drawing is conducted at a temperature suitable to sufficiently soften the preform rod to allow it to be drawn into a fiber. The drawing is generally conducted at a speed suitable to render the fiber useful as an optical conductor.~~⁷³²

~~In yet another aspect, the invention provides a graded index plastic optical material comprising: (a) a transparent sheathing comprising a sheathing polymer and a sheathing dopant, wherein the sheathing dopant has a refractive index which is less than that of the sheathing~~⁷³³ ~~polymer, and (b) a transparent core, disposed within the~~⁷³⁴

~~-18~~⁷³⁵

~~sheathing, comprising a core polymer having a refractive index greater than that of the sheathing and an optional core dopant, the core dopant, when present, having a refractive index which is greater than that of the core~~⁷³⁶ ~~polymer, wherein the core dopant has a concentration gradient in a specific direction. The refractive index of the core is greater than the doped~~⁷³⁷ ~~sheathing.~~

~~In a preferred embodiment, the graded index plastic optical material is in the shape of a cylindrical preform~~⁷³⁸

rod. In another application, the graded index plastic optical material is in the shape of a cylindrical fiber having an outer diameter between about 0.2 millimeters and about 1 millimeter. The fiber can be prepared, for example, by hot-drawing a preform rod, the fiber⁷³⁹ maintaining the same geometry of the preform but, with a smaller outer diameter.⁷⁴⁰

In certain embodiments, the graded index plastic optical material has the same polymer in both the sheathing and the core. In this particular embodiment, when the⁷⁴¹ optional core dopant is present, the core dopant and the sheathing dopant are different substances. The sheathing dopant has a refractive index which is less than that of the core dopant. The difference in refractive index between the dopants should be such that resulting optical⁷⁴² material is suitable to conduct light. For example, the material should be useful as an optical conductor. For example, when the polymer of the core and sheathing is⁷⁴³ at the desired wavelength. Additionally, for such embodiments, the refractive index of the core dopant is preferably greater than that of the sheathing dopant. For example, when the core polymer and sheathing polymer are⁷⁴⁴ poly(methyl methacrylate), the dopant for the⁷⁴⁵ sheathing dopant can⁷⁴⁶ could⁷⁴⁷ be tributyl phosphate (refractive index = 1.424) and⁷⁴⁸ while⁷⁴⁹ the core⁷⁵⁰ dopant can⁷⁵¹ dopant for the core could⁷⁵² be diphenyl sulfide (refractive index = 1.6327). When the polymer of the core and sheathing is, for example, that obtained upon polymerization of the monomer 2,2bis(trifluoromethyl)-4,5-difluoro-1,3-dioxole, the sheathing dopant and core dopant are different substances,⁷⁵³ with the difference in the refractive index between the⁷⁵⁴

⁷⁵⁵ dopants such that the optical material is suitable to conduct light. In addition, the refractive index of the core dopant is higher than the sheathing dopant with both dopants being⁷⁵⁶ Other preferred embodiments where the sheathing and the core include the same polymerized monomer, for example a perfluorinated monomer, utilize different sheathing and core dopants where both dopants are⁷⁵⁷ perhalogenated.

The advantages⁷⁵⁸ A significant advantage⁷⁵⁹ of the method⁷⁶⁰ methods⁷⁶¹ of the invention include the availability of a significantly broader range of dopant and monomer⁷⁶² materials which are useful in preparing a graded⁷⁶³ the inventive gradient⁷⁶⁴ index plastic optical material.⁷⁶⁵ articles.⁷⁶⁶ This increase in the range and⁷⁶⁷ types of materials suitable for use in the invention provides, for example, the ability to increase the difference in the refractive index⁷⁶⁸ indices⁷⁶⁹ between the sheathing and the core without unduly⁷⁷⁰ compromising the performance⁷⁷¹ characteristics of the optical material⁷⁷² article,⁷⁷³ and, in some cases,⁷⁷⁴ the ability to widen the operating wavelength range⁷⁷⁵ of the material⁷⁷⁶ articles. This is⁷⁷⁷ particularly important⁷⁷⁸ when the articles are⁷⁷⁹ employed in data communications-⁷⁸⁰ applications.⁷⁸¹ In addition, the concentration of dopant in the core, necessary to provide the required difference in refractive index⁷⁸² indices⁷⁸³, can be decreased when a sheathing dopant, having a lower⁷⁸⁴ which lowers the⁷⁸⁵ refractive index than⁷⁸⁶ of⁷⁸⁷ the polymeric⁷⁸⁸ sheathing polymer⁷⁸⁹, is present. This decrease in the required⁷⁹⁰ concentration of the core dopant can⁷⁹¹ significantly improve⁷⁹² improve⁷⁹³ the miscibility of the core dopant⁷⁹⁴ materials which directly impacts the optical

characteristics, for example, transparency of the optical material. Further⁷⁹⁵ article. Furthermore⁷⁹⁶, the sheathing dopant, in many instances, behaves as a plasticizer in the graded index plastic optical material.⁷⁹⁷ will also behave as a plasticizer. Plasticizers, including plasticizing dopants, can enable hot-drawing of the preform article according to the invention into, for example, an optical fiber at a lower temperature and/or higher drawing speed as previously discussed.⁷⁹⁸ This plasticizer-like behavior allows for hot drawing of the material, for example, in the shape of a preform rod at a lower temperature and/or higher speed.⁷⁹⁹

Plasticizers, including plasticizing dopants, also provides advantages when forming the optical preform article during polymerization. In typical prior art methods not employing a sheathing plasticizer, when the core monomer is polymerized within the sheathing tube, the core has a tendency to shrink in a radial direction as polymerization proceeds. This results in the polymeric core separating from the sheathing during the polymerization causing the formation of bubbles at the interface between the sheathing and the core for a significant fraction of the articles produced. These bubbles are very detrimental to the optical performance of the article, and normally are cut out of the article, thus reducing its length, or the article containing the bubbles is simply discarded. With the present invention, the sheathing plasticizer can soften the polymeric sheathing, by lowering the glass transition temperature, an effective amount so that the sheathing will remain in contact with the core to a greater extent during core polymerization. In this way, the quantity of bubbles formed at the interface can be markedly reduced. Specifically, the present invention provides a method for the consistent production of plastic optical articles, each having an interface between the polymeric sheathing and polymeric core that is essentially free of visible bubbles. The mechanical property advantages of including dopants and/or plasticizers in the sheathing are not limited to applications involving gradient index plastic optical articles. Similar advantages, for example an increase in permissible drawing speed, may be realized for step-index plastic optical articles, plastic optical lenses, plastic optical waveguides, and plastic optical integrated circuits.⁸⁰⁰

The invention will now be further illustrated by the following examples which are not intended to limit the scope of the invention in any way. All percentages are by weight unless otherwise specified.

-20⁸⁰¹

EXEMPLIFICATION⁸⁰²

EXAMPLE 1:

PREPARATION OF SHEATHING

A sheathing solution containing 1600 g (92.2 %wt)⁸⁰³ of purified methyl methacrylate (MMA), 4.00 g (0.25 weight percent of MMA⁸⁰⁴ 0.23 %wt⁸⁰⁵) of lauryl peroxide as the polymerization initiator, 3.42 ml of 1-butanethiol (0.18 weight percent of MMA⁸⁰⁶ 0.17 %wt⁸⁰⁷) as the chain transfer reagent (available from Aldrich Chemical Co., Inc.^{808 809} Milwaukee, WI) and 128 g (8 weight percent of MMA⁸¹⁰ 811) of dicyclohexyl phthalate (7.4 %wt) as the sheathing dopant⁸¹² was stirred and degassed for about 30 minutes.

To an appropriately stoppered glass tube, having an inner diameter of 30 mm and a length of 1.5 meters was added sheathing solution, to the appropriate^{813 814} a height of 1 meter⁸¹⁵ to achieve the desired^{816 817} a final ratio of

core to sheathing thickness. For example⁸¹⁸ of about 2:3. In general⁸¹⁹, a final ratio of the thickness of the sheathing wall to core thickness can be between about 1:4 to about 2:1. Both ends of the tube were sealed, and then the tube was placed in a water bath at a temperature of 71°⁸²⁰ degrees⁸²¹ C and polymerized while being rotated at approximately 500 rpm for 20 hours. The tube was then placed in a rotating oven (approximately 5 rpms) for two hours at 100°C. A poly(methyl methacrylate)⁸²² degrees C. A polymeric⁸²³ sheathing tube was prepared⁸²⁴ thus obtained⁸²⁵.

PREPARATION OF CORE⁸²⁶

The sheathing prepared above was kept in the glass tube, and the container formed by the cylindrical inner surface of the sheathing was filled with a solution containing 350 g (92.1 %wt)⁸²⁷ of MMA, 200 microliters of t-butyl peroxide, 600 microliters of 1-dodecanethiol and 30 grams (8.5 weight percent⁸²⁸ (7.9 %wt)⁸²⁹) of diphenyl sulfide⁸³⁰ as the core dopant.⁸³¹ The tube was sealed and then heated in a vertical position at 90°⁸³² degrees⁸³³ C for at least 12⁸³⁴ 24⁸³⁵ hours. The tube was then placed in the oven horizontally and heated for 12 hours at 90°⁸³⁶ degrees⁸³⁷ C, 24 hours at

-21⁸³⁸ 110°⁸³⁹ 110 degrees⁸⁴⁰ C, 10 hours at 120°⁸⁴¹ degrees⁸⁴² C and 4 hours at 130°⁸⁴³ degrees⁸⁴⁴ C while rotating at a speed of 5 rpm⁸⁴⁵ rpm⁸⁴⁶.

The graded⁸⁴⁷ gradient⁸⁴⁸ index plastic optical preform rod was then removed from the glass polymerization container. The rod was then slowly inserted into a cylindrical heating furnace from the top while the furnace was maintained at a temperature between 180°⁸⁴⁹ degrees⁸⁵⁰ C and 220°⁸⁵¹ degrees⁸⁵² C. When the rod was softened sufficiently, hot-drawing and⁸⁵³ spinning into an optical fiber⁸⁵⁴ at a constant speed of approximately 5-15 meters⁸⁵⁵ ⁸⁵⁶ 857 /min was started from the bottom of the rod.

EXAMPLE 2+⁸⁵⁸

PREPARATION OF SHEATHING

A polymeric sheathing was prepared as in Example 1 above, except that the⁸⁵⁹ sheathing solution containing 1600 g of purified methyl methacrylate (MMA), 4.00 g (0.25 weight percent of⁸⁶⁰ MMA) of lauryl peroxide as the polymerization initiator, 3.42 ml of 1-butanethiol (0.18 weight percent of MMA) as the chain transfer reagent (available from Aldrich Chemical Co., Inc., Milwaukee, WI) and 320 g (20 weight percent of MMA⁸⁶¹ contained 320 g (16.6 %wt)⁸⁶²) of dicyclohexyl phthalate was stirred and degassed for⁸⁶³ as the sheathing dopant.⁸⁶⁴ about 30 minutes.⁸⁶⁵

To an appropriately stoppered glass tube, having an inner diameter of 30 mm and a length of 1.5 meters was added sheathing solution, to the appropriate height to achieve the desired final ratio of core to sheathing⁸⁶⁶ thickness. For example, a final ratio of sheathing to core thickness can be between about 1:4 to 2:1. Both ends of the tube were sealed, and then the tube was placed in a water bath at a temperature of 71°C and polymerized while being rotated at approximately 500 rpm for 20 hours. The⁸⁶⁷ tube was then placed in a rotating oven (approximately 5 rpms) for two hours at 100°C. A poly(methyl methacrylate) sheathing tube was prepared.⁸⁶⁸

PREPARATION OF CORE:

~~The sheathing prepared above was kept in the glass tube, and the container formed by the inner surface of the sheathing was filled with a solution containing 350 g of~~⁸⁷⁰ A polymeric core, preform rod and optical fiber were prepared as in Example 1 above, except that the core solution contained no added core dopant.⁸⁷¹

~~MMA, 200 microliters of t-butyl peroxide and 600 microliters of 1-dodecanethiol. The tube was sealed and then heated in a vertical position at 90°C for at least 12 hours. The tube was then placed in the oven horizontally and heated for 12 hours at 90°C, 24 hours at 110°C, 10~~⁸⁷²

~~hours at 120°C and 4 hours at 130°C while rotating at a speed of 5 rpm.~~⁸⁷³

~~The graded index plastic optical preform rod was then removed from the glass polymerization container. The rod was then slowly inserted into a cylindrical heating furnace~~⁸⁷⁴

~~from the top thereof while the furnace was maintained at a temperature between 180°C and 220°C. When the rod was softened sufficiently, spinning at a constant speed of approximately 5-15 meters/min was started from the bottom~~⁸⁷⁵
~~of the rod.~~⁸⁷⁶

EXAMPLE 3⁸⁷⁷

A polymeric sheathing, polymeric core, plastic optical preform rod, and optical fiber were prepared as outlined in Example 1, except that 2,2,4-trimethyl-1,3-pentanediol diisobutyrate was substituted for dicyclohexyl phthalate as the sheathing dopant.⁸⁷⁸

EXAMPLE 4⁸⁷⁹

A polymeric sheathing, polymeric core, plastic optical preform rod, and optical fiber were prepared as outlined in Example 2, except that 2,2,4-trimethyl-1,3-pentanediol diisobutyrate was substituted for dicyclohexyl phthalate as the sheathing dopant.⁸⁸⁰

EXAMPLE 5⁸⁸¹

A polymeric sheathing, polymeric core, plastic optical preform rod, and optical fiber were prepared as outlined in Example 1, except that diethyl succinate was substituted for dicyclohexyl phthalate as the sheathing dopant.⁸⁸²

EXAMPLE 6⁸⁸³

A polymeric sheathing, polymeric core, plastic optical preform rod, and optical fiber were prepared as outlined in Example 2, except that diethyl succinate was substituted for dicyclohexyl phthalate as the sheathing dopant.⁸⁸⁴

EQUIVALENTS⁸⁸⁵

Those skilled in the art will recognize, or be able to ascertain using no more than routine experimentation, many equivalents to the specific embodiments of the invention described herein. Such equivalents are intended to be encompassed by the following claims.

What is claimed is:⁸⁸⁸

Claims⁸⁸⁹

1. A graded⁸⁹⁰ gradient⁸⁹¹ index plastic optical material⁸⁹² article⁸⁹³ comprising:
a) ~~a~~⁸⁹⁴ a polymeric sheathing, which is at least partially⁸⁹⁵
transparent to light at at least one wavelength, including a⁸⁹⁶ sheathing having
a sheathing⁸⁹⁷ polymer and a sheathing dopant, the sheathing dopant having a
refractive index which is less than that of the sheathing polymer, and⁸⁹⁸ an
equivalent polymeric sheathing without the sheathing dopant; and⁸⁹⁹
b) ~~a transparent core disposed within the sheathing, comprising a core~~
~~polymer having a refractive~~⁹⁰⁰
~~index greater than that of the sheathing and an optional core dopant~~⁹⁰¹
a polymeric core, including a core polymer, coaxially disposed within said
sheathing, said core being at least partially transparent to light at at least
one wavelength and⁹⁰² having a gradient in⁹⁰³ refractive index which is greater
than that of the core polymer, wherein the core dopant has a concentration
gradient⁹⁰⁴ in a specific direction.
2. The material⁹⁰⁵ article⁹⁰⁶ of Claim 1⁹⁰⁷ claim 1,⁹⁰⁸ wherein said sheathing
dopant lowers⁹⁰⁹ the refractive index of the transparent core is greater than
that of the transparent sheathing such that the material is⁹¹⁰ suitable to conduct
light⁹¹¹ polymeric sheathing by at least 0.0005 compared to an equivalent
sheathing without said sheathing dopant⁹¹².
3. ~~The material of Claim 1 in the shape of a cylindrical preform rod.~~⁹¹³
3. The article of claim 1, wherein said sheathing dopant is present in the
polymeric sheathing at an overall concentration less than 35 %wt.⁹¹⁴
4. ~~The material of Claim 1 in the shape of a cylindrical fiber having an~~
~~outer diameter between about 0.2 millimeters and about 1 millimeter.~~⁹¹⁵
4. The article of claim 1, wherein said sheathing dopant is present in the
polymeric sheathing at an overall concentration less than 20 %wt.⁹¹⁶
5. The material⁹¹⁷ article⁹¹⁸ of Claim 1 wherein ~~the sheathing and core polymers~~
~~are formed from different polymerizable monomers~~⁹¹⁹ claim 1, wherein said
sheathing dopant is present in the polymeric sheathing at an overall
concentration less than 15 %wt⁹²⁰.
6. The material⁹²¹ article⁹²² of Claim 1 wherein ~~the sheathing and core polymers~~
~~are formed from the same polymerizable monomer~~⁹²³ claim 1, wherein the
interface between said polymeric sheathing and said polymeric core is
essentially free of visible bubbles⁹²⁴.
- 24⁹²⁵
7. ~~The material of Claim 6 wherein the polymerizable monomer is methyl~~
~~methacrylate.~~⁹²⁶

7. The article according to claim 1, wherein said polymeric sheathing and said polymeric core are both at least partially transparent to the same at least one wavelength of light.⁹²⁷

8. The material⁹²⁸ article⁹²⁹ of Claim 7 wherein the sheathing dopant is dimethyl sebatate⁹³⁰ claim 1, wherein said polymeric core further includes a core dopant having a refractive index which is greater than that of an equivalent polymeric core without the core dopant.⁹³¹

9. The material of Claim 8 wherein the core dopant is benzyl benzoate.⁹³² article according to claim 8, wherein the refractive index of the central axis of the polymeric core exceeds that of the polymeric sheathing by at least 0.01.⁹³³

10. The material of Claim 7⁹³⁴ The article according to claim 9,⁹³⁵ wherein the sheathing dopant is diisobutyl adipate⁹³⁶ overall concentration of said core dopant in said polymeric core is less than 12 %wt⁹³⁷.

11. The material of Claim 10 wherein the core dopant is benzyl benzoate.⁹³⁸ 11. The article of claim 9, wherein said article has a maximum service temperature of at least 40 degrees C.⁹³⁹

12. The material of Claim 6 wherein the polymerizable monomer is 2,2-bis(trifluoromethyl)-4,5-difluoro-1,3-dioxole.⁹⁴⁰

13. The material of Claim 1 wherein the core dopant is not present.⁹⁴¹ 12. The article of claim 8, wherein said core dopant has a concentration gradient within said core in the same direction as the gradient in refractive index.⁹⁴²

14. A method for forming a graded index plastic optical⁹⁴³ material, comprising the steps of:⁹⁴⁴

(a) providing a transparent tube of sheathing⁹⁴⁵ material comprising a sheathing polymer and a sheathing dopant, and⁹⁴⁶

(b) forming a transparent core, within the sheathing tube produced in step (a), said core having a refractive index greater than that of the sheathing tube⁹⁴⁷ by:⁹⁴⁷

13. The article of claim 12 wherein, said polymeric core further includes said sheathing dopant having a concentration gradient within the core in a specific direction opposite that of said direction of the concentration gradient of the core dopant.⁹⁴⁸

-25⁹⁴⁹

(i) filling the sheathing tube with a core solution comprising a core polymerizable monomer, which upon polymerization, has a refractive index greater than that of the⁹⁵⁰

sheathing tube and with an optional core dopant having a refractive index greater than that of the polymer obtained upon polymerization of the core monomer, and⁹⁵¹

(ii) polymerizing the core monomer of the core⁹⁵²

~~— solution to form a graded index plastic optical material having an outer sheathing and an inner core.~~⁹⁵³

14. The article of claim 1, wherein the refractive index at the central axis of said polymeric core is greater than the refractive index of said polymeric sheathing, where said article conducts light at at least one wavelength with an attenuation less than 500 dB/km.⁹⁵⁴

~~15. The method of Claim 14 wherein the sheathing tube is made by:~~⁹⁵⁵ The article of claim 14, wherein said article conducts light at at least one wavelength with an attenuation less than 200 dB/km.⁹⁵⁶

~~(a) placing into a polymerization container a sheathing solution comprising a sheathing polymerizable monomer and a sheathing dopant, the sheathing dopant having a refractive index lower than that of the polymer obtained by the~~⁹⁵⁷

~~polymerization of the sheathing monomer; and~~⁹⁵⁸

~~(b) causing the sheathing monomer of the sheathing solution to polymerize within the polymerization container in a cylindrical configuration to form a transparent sheathing tube.~~⁹⁵⁹

16. The method⁹⁶⁰ article⁹⁶¹ of Claim 15⁹⁶² claim 1,⁹⁶³ wherein the material is in the⁹⁶⁴ shape of a⁹⁶⁵ the article is an essentially⁹⁶⁶ cylindrical-preform⁹⁶⁷ rod.

~~17. The method of Claim 15 wherein the sheathing and core polymerizable monomers are different.~~⁹⁶⁸

17. The article of claim 16, wherein said rod is hot-drawn into a fiber that conducts light having a diameter less than said rod at a draw rate of at least 3 m/min.⁹⁶⁹

18. The method of Claim 15 wherein the sheathing and core polymerizable monomers are the same⁹⁷⁰ article of claim 1, wherein the shape of the article is an essentially cylindrical fiber having an outer diameter less than 1 millimeter⁹⁷¹.

-26⁹⁷²

19. The method⁹⁷³ article⁹⁷⁴ of Claim 18⁹⁷⁵ claim 1,⁹⁷⁶ wherein the⁹⁷⁷ said sheathing polymer and said core polymer are formed from different⁹⁷⁸ polymerizable monomer is methyl methacrylate⁹⁷⁹ monomers⁹⁸⁰.

20. The method⁹⁸¹ article⁹⁸² of Claim 18⁹⁸³ claim 1,⁹⁸⁴ wherein the⁹⁸⁵ said sheathing polymer and said core polymer are formed from the same⁹⁸⁶ polymerizable monomer is 2,2-bis(trifluoromethyl)-4,5-difluoro-1,3,5-dioxole⁹⁸⁷.

21. The article of claim 20, wherein the polymerizable monomer is methyl methacrylate.⁹⁸⁸

22. The article of claim 1, wherein said sheathing dopant is dimethyl sebatate.⁹⁸⁹

23. The article of claim 1, wherein said sheathing dopant is diisobutyl adipate.⁹⁹⁰

24. The article of claim 1, wherein said sheathing dopant is 2,2,4-trimethyl-1,3-pentanediol diisobutyrate.⁹⁹¹

25. The article of claim 1, wherein said sheathing dopant is diethyl succinate.⁹⁹²

26. The article of claim 8, wherein said core dopant is benzyl benzoate.⁹⁹³

27. The article of claim 8, wherein said sheathing dopant is dimethyl sebatate and said core dopant is benzyl benzoate.⁹⁹⁴

29. The article of claim 8, wherein said sheathing dopant is diisobutyl adipate and said core dopant is benzyl benzoate.⁹⁹⁵

30. The article of claim 8, wherein said sheathing dopant is 2,2,4-trimethyl-1,3-pentanediol diisobutyrate and said core dopant is benzyl benzoate.⁹⁹⁶

31. The article of claim 8, wherein said sheathing dopant is diethyl succinate and said core dopant is benzyl benzoate.⁹⁹⁷

32. A method for forming a gradient index plastic optical article comprising:⁹⁹⁸

(a) forming a tube of polymeric sheathing material that is at least partially transparent to light at least one wavelength from at least one polymerizable sheathing monomer including a sheathing dopant; and⁹⁹⁹

(b) forming a polymeric core that is at least partially transparent to light at at least one wavelength within the tube formed in step (a), with said core having a gradient in refractive index in a specific direction by:¹⁰⁰⁰

(i) filling said tube with a composition including at least one polymerizable core monomer; and¹⁰⁰¹

(ii) polymerizing said core monomer.¹⁰⁰²

33. The method of claim 32, wherein said tube of sheathing material is formed by:¹⁰⁰³

(a) supplying a cylindrical polymerization container;¹⁰⁰⁴

(b) placing a quantity of a composition including said at least one polymerizable sheathing monomer and said sheathing dopant into said container; and¹⁰⁰⁵

(c) polymerizing said sheathing monomer to form a hollow polymeric tube.¹⁰⁰⁶

34. The method of claim 32, wherein said sheathing dopant has a refractive index less than said polymerizable sheathing monomer when polymerized without the sheathing dopant.¹⁰⁰⁷

35. The method of claim 32, wherein the composition in step (b)(i) further includes a core dopant.¹⁰⁰⁸

36. The method of claim 35, wherein the core dopant has a refractive index greater than that of the polymerizable core monomer when polymerized without the core dopant.¹⁰⁰⁹

37. The method of claim 32, wherein energy is supplied during step (b)(ii).¹⁰¹⁰

38. The method of claim 33, wherein energy is supplied during step (c).¹⁰¹¹

39. The method of claim 37, wherein said energy is in the form of heat.¹⁰¹²

40. The method of claim 38, wherein said energy is in the form of heat.¹⁰¹³

41. The method of claim 33, wherein said polymerization container is rotated during step (c).¹⁰¹⁴

42. The method of claim 32, wherein said polymerizable sheathing monomer and said polymerizable core monomer are different.¹⁰¹⁵

43. The method of claim 32, wherein said polymerizable sheathing monomer and said polymerizable core monomer are the same.¹⁰¹⁶

44. The method of claim 43, wherein the polymerizable monomer is methyl methacrylate.¹⁰¹⁷

45. The method of claim 32 further comprising the step of hot-drawing the article formed after the completion of step (b) at a predetermined temperature and speed to form a gradient index optical fiber.¹⁰¹⁸

46. A gradient index plastic optical article having a polymeric sheathing that includes a sheathing dopant.¹⁰¹⁹

47. A gradient index plastic optical article comprising:¹⁰²⁰
a polymeric sheathing, which is at least partially transparent to light at at least one wavelength, including a sheathing polymer; and¹⁰²¹
a polymeric core coaxially disposed within said sheathing, which is at least partially transparent to light at at least one wavelength, including a core polymer and a specific overall concentration of a core dopant having a refractive index greater than that of the core polymer, said core dopant having a concentration gradient within the core in a specific direction;¹⁰²²

said polymeric sheathing being constructed and arranged so that a difference in refractive indices between the central axis of said polymeric core, having said overall concentration of core dopant, and said polymeric sheathing exceeds a difference in refractive indices between said central axis of said polymeric core, having said overall concentration of core dopant, and said sheathing polymer.¹⁰²³

48. The article of claim 47, wherein said overall concentration of core dopant is zero.¹⁰²⁴

49. The article of claim 47, wherein said polymeric sheathing includes a sheathing dopant having a refractive less than that of said sheathing polymer.¹⁰²⁵

50. The article of claim 47, wherein the refractive index at the central axis of said polymeric core is greater than the refractive index of said polymeric sheathing, where said article conducts light at at least one wavelength with an attenuation less than 500 dB/km.¹⁰²⁶

51. A gradient index plastic optical article comprising:¹⁰²⁷

a polymeric sheathing, which is at least partially transparent to light at at least one wavelength, including a sheathing polymer; and¹⁰²⁸

a polymeric core coaxially disposed within said sheathing, which is at least partially transparent to light at at least one wavelength, comprising a core polymer and a core dopant having a refractive index greater than that of the core polymer and present at a first overall concentration sufficient to create a difference in refractive indices between the central axis of the core and the sheathing of a desired value, said core dopant having a concentration gradient within the core in a specific direction;¹⁰²⁹

said polymeric sheathing being constructed and arranged so that the maximum service temperature of the article exceeds that of an equivalent article except having a sheathing comprised only of sheathing polymer and having a second overall core dopant concentration required to create a difference in refractive indices between the central axis of the core and the sheathing equal to said desired value.¹⁰³⁰

52. The article of claim 51, wherein said overall concentration of core dopant is zero and where said polymeric core has a refractive index gradient within the core in a specific direction.¹⁰³¹

53. The article of claim 51, wherein said polymeric sheathing includes a sheathing dopant having a refractive less than that of said sheathing polymer.¹⁰³²

54. The article of claim 51, wherein the refractive index at the central axis of said polymeric core is greater than the refractive index of said polymeric sheathing, where said article conducts light at at least one wavelength with an attenuation less than 500 dB/km.¹⁰³³

55. A gradient index plastic optical article comprising:¹⁰³⁴

a polymeric sheathing, which is at least partially transparent to light at at least one wavelength, including a sheathing polymer ; and¹⁰³⁵

a polymeric core coaxially disposed within said sheathing, which is at least partially transparent to light at at least one wavelength, including a core polymer and a core dopant having a refractive index greater than that of the core polymer and present at a first overall concentration sufficient to create a difference in refractive indices between the central axis of the core and the sheathing of a desired value, said core dopant having a concentration gradient within the core in a specific direction;¹⁰³⁶

said polymeric sheathing being constructed and arranged so that said light at at least one wavelength is conducted by the article with less attenuation than by an equivalent article except having a sheathing comprised only of sheathing polymer and having a second overall core dopant concentration

required to create a difference in refractive indices between the central axis of the core and the sheathing equal to said desired value.¹⁰³⁷

56. The article of claim 55, wherein said overall concentration of core dopant is zero.¹⁰³⁸

57. The article of claim 55, wherein said polymeric sheathing includes a sheathing dopant having a refractive less than that of said sheathing polymer.¹⁰³⁹

58. The article of claim 55, wherein the refractive index at the central axis of said polymeric core is greater than the refractive index of said polymeric sheathing, where said article conducts light at at least one wavelength with an attenuation less than 500 dB/km.¹⁰⁴⁰

59. A plastic optical preform article comprising:¹⁰⁴¹
a polymeric sheathing, which is at least partially transparent to light at at least one wavelength and possesses a refractive index of a first value at said at least one wavelength, including a sheathing polymer and a plasticizer; and¹⁰⁴²
a polymeric core, coaxially disposed within said sheathing, which is at least partially transparent to light at at least one wavelength, possesses a refractive index of a second value at the central axis of the core at said at least one wavelength, and includes a core polymer; said second value of refractive index exceeding said first value.¹⁰⁴³

60. The article of claim 59, wherein the polymeric core has a refractive index gradient within the core in a specific direction.¹⁰⁴⁴

61. The article of claim 59, wherein said preform can be formed into an essentially cylindrical optical fiber having an outer diameter less than 1 millimeter by extrusion.¹⁰⁴⁵

62. The article of claim 61, wherein said fiber conducts light at at least one wavelength with an attenuation less than 500 dB/km.¹⁰⁴⁶

63. The article of claim 59, wherein said preform can be formed into an essentially cylindrical optical fiber having an outer diameter less than 1 millimeter by hot-drawing.¹⁰⁴⁷

64. The article of claim 63, wherein said fiber conducts light at at least one wavelength with an attenuation less than 500 dB/km.¹⁰⁴⁸

65. The article of claim 64, wherein said fiber is hot-drawn from said rod at a drawing speed of at least 3 m/min.¹⁰⁴⁹

66. The article of claim 64, wherein said fiber is hot-drawn from said rod at a drawing speed of at least 5 m/min.¹⁰⁵⁰

~~21. The method of Claim 15, further comprising the step of: hot-drawing the graded index plastic optical material at a temperature and speed, to thereby obtain a graded index plastic optical fiber.~~¹⁰⁵¹

67. The article of claim 59, wherein said plasticizer acts as a sheathing dopant having a refractive index which is less than that of said sheathing polymer.¹⁰⁵²

22. A graded index plastic optical fiber produced by the method of Claim 21 which is optionally jacketed with a suitable jacketing composition in either a single or duplex configuration.¹⁰⁵³

68. The article of claim 59, when said polymeric core further includes a core dopant.¹⁰⁵⁴

23. A tube of sheathing material comprising a sheathing polymer and a sheathing dopant.¹⁰⁵⁵¹⁰⁵⁶

69. The article of claim 59, wherein said sheathing polymer and said core polymer are formed from the same polymerizable monomer.¹⁰⁵⁷

70. The article of claim 69, wherein the polymerizable monomer is a perfluorinated monomer which yields an amorphous perfluorinated polymer upon polymerization.¹⁰⁵⁸

71. The article of claim 59, wherein said sheathing polymer and said core polymer are formed from the different polymerizable monomers.¹⁰⁵⁹

72. The article of claim 71, wherein the polymerizable monomer forming the sheathing polymer is a perfluorinated monomer which yields an amorphous perfluorinated polymer upon polymerization.¹⁰⁶⁰

73. A method for making a gradient index plastic optical fiber comprising:¹⁰⁶¹
forming a polymeric preform rod comprising a polymeric sheathing and a polymeric core coaxially disposed within said sheathing, said polymeric core having a gradient in refractive index in a specific direction; and¹⁰⁶²
hot-drawing said rod at a draw rate of at least 3 m/min into a fiber that conducts light of at least one wavelength with an attenuation less than 500 dB/km.¹⁰⁶³

74. A plastic optical preform article comprising:¹⁰⁶⁴
a polymeric sheathing, which is at least partially transparent to light at at least one wavelength, possesses a refractive index of a first value at said at least one wavelength, and includes a sheathing polymer; and¹⁰⁶⁵
a polymeric core, coaxially disposed within said sheathing, which is at least partially transparent to light at at least one wavelength, possesses a refractive index of a second value at the central axis of the core at said at least one wavelength, and includes a core polymer and a core dopant having a refractive index greater than that of the core polymer and present at a specified overall concentration;¹⁰⁶⁶

said second value of refractive index exceeding said first value by at least 0.01 at said at least one wavelength, with said specified overall core dopant concentration not exceeding 12 %wt.¹⁰⁶⁷

75. A plastic optical article comprising:¹⁰⁶⁸

a polymeric sheathing, which is at least partially transparent to light at at least one wavelength, possesses a refractive index of a first value at said at least one wavelength, and includes a sheathing polymer; and¹⁰⁶⁹
a polymeric core, coaxially disposed within said sheathing, which is at least partially transparent to light at at least one wavelength, possesses a refractive index of a second value at the central axis of the core at said at least one wavelength, and includes a core polymer and a core dopant having a refractive index greater than that of the core polymer; ¹⁰⁷⁰
said second value of refractive index exceeding said first value by at least 0.01 at said at least one wavelength, and the operating temperature of the article being at least 40 degrees C. ¹⁰⁷¹

ABSTRACT-OF THE DISCLOSURE¹⁰⁷²

-Graded plastic¹⁰⁷³ Polymeric¹⁰⁷⁴ optical materials¹⁰⁷⁵ articles¹⁰⁷⁶, including gradient index optical¹⁰⁷⁷ preforms and fibers¹⁰⁷⁸ fiber¹⁰⁷⁹ produced therefrom, are described. Methods for producing the optical materials¹⁰⁸⁰ articles¹⁰⁸¹ using plasticizers and/or¹⁰⁸² dopants in the sheathing of the material¹⁰⁸³ articles¹⁰⁸⁴ are also described. The graded¹⁰⁸⁵ Gradient¹⁰⁸⁶ index plastic¹⁰⁸⁷ optical materials¹⁰⁸⁸ articles made according to the invention¹⁰⁸⁹ have excellent optical characteristics, enhanced flexibility¹⁰⁹⁰ mechanical properties¹⁰⁹¹ and good¹⁰⁹² environmental stability, and enable more flexibility in the selection of materials.¹⁰⁹³
